INTRODUCTION

OLE for Retail POS Controls

What Is “OLE for Retail POS?”

OLE for Retail POS provides an open device driver architecture that allows Point-of-Sale (“POS”)¹ hardware to be easily integrated into POS systems based on Microsoft Windows-95/98, Microsoft Windows-NT and Microsoft Windows 2000.²

The goals of OLE for Retail POS (or “OPOS”) include:

- Defining an architecture for Win32-based POS device access.
- Defining a set of POS device interfaces sufficient to support a range of POS solutions.

Deliverables in this release of OPOS are:

- Application Programmer’s Guide – this document: For application developers and hardware providers.
- Control Programmer’s Guide: For hardware providers.
- Header files with OPOS constants.
- No complete software components: Hardware providers or third-party providers develop and distribute these components.

¹ POS may also refer to Point-of-Service – a somewhat broader category than Point-of-Sale.

² Other future operating systems that support OLE Controls may also support OLE for Retail POS, depending upon software support by the hardware manufacturers or third-party developers.

Who Should Read This Document

The Application Programmer's Guide is targeted to an application developer who requires access to POS-specific peripheral devices. It is also targeted for the system developer who will write an OPOS Control.

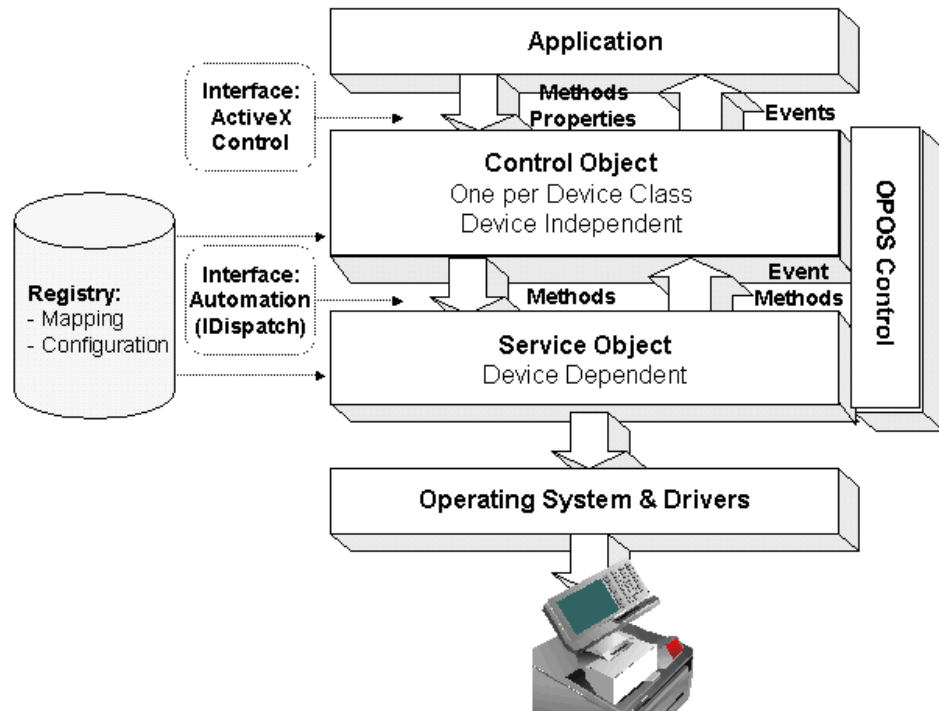

This guide assumes that the reader is familiar with the following:

- General characteristics of POS peripheral devices.
- ActiveX and Automation terminology and architecture.
- Familiarity with an ActiveX Control Container development environment, such as Microsoft Visual Basic or Microsoft Visual C++, will be useful.

General OLE for Retail POS Control Model

OLE for Retail POS Controls adhere to the ActiveX Control specifications. They expose properties, methods, and events to a containing Application. The controls are invisible at run time, and rely exclusively upon the containing application for requests through methods and sometimes properties. Responses are given to the application through method return values and parameters, properties, and events.

The OLE for Retail POS software is implemented using the layers shown in the following diagram:

OPOS Definitions

Device Class

A device class is a category of POS devices that share a consistent set of properties, methods, and events. Examples are Cash Drawer and POS Printer.

Some devices support more than one device class. For example, some POS Printers include a Cash Drawer kickout. Also, some Bar Code Scanners include an integrated Scale.

Control Object or CO

A Control Object exposes a set of properties, methods, and events to an application for its device class. This guide describes these APIs.

A CO is a standard ActiveX (that is, OLE 32-bit) Control that is invisible at runtime. The CO interfaces have been designed so that all implementations of a class' Control Object will be compatible. This allows the CO to be developed independently of the SO's for the same class – including development by different companies.

Service Object or SO

A Service Object is called by a Control Object to implement the OPOS-prescribed functionality for a specific device.

An SO is implemented as an Automation server. It exposes a set of methods that are called by a CO. It can also call special methods exposed by the CO to cause events to be delivered to the application.

A Service Object may include multiple sets of methods in order to support devices with multiple device classes.

A Service Object is typically implemented as a local in-proc server (in a DLL). In theory, it may also be implemented as a local out-proc server (in a separate executable process). However, we have found that, in practice, out-proc servers do not work well for OPOS Service Objects, and do not recommend their use.

OPOS Control or Control

An OPOS Control consists of a Control Object for a device class – which provides the application interface, plus a Service Object – which implements the APIs. The Service Object must support a device of the Control Object's class.

Usually, this guide will refer to “Control.” On occasion, we must distinguish between the actions performed by the Control Object and Service Object. Then the explicit layer is specified.

How an Application Uses an OPOS Control

The first action the application must take on the Control is to call its **Open** method. The parameter of this method selects a device name to associate with the Control. The **Open** method performs the following steps:

- Establishes a link to the device name.
- Initializes the properties **OpenResult**, **Claimed**, **DeviceEnabled**, **DataEventEnabled**, **FreezeEvents**, **AutoDisable**, **DataCount**, and **BinaryConversion**, as well as descriptions and version numbers of the OPOS Control layers. Additional class-specific properties may also be initialized.

Several applications may have an OPOS Control open at the same time. Therefore, after the device is opened, the application will often need to call the **ClaimDevice** method to gain exclusive access to the device. Many devices must be claimed before the Control allows access to its methods and properties. Claiming the device ensures that other applications do not interfere with the use of the device. The application may call the **ReleaseDevice** method when the device can be shared by other applications – for instance, at the end of a transaction.

Before using the device, the application must set the **DeviceEnabled** property to TRUE. This value brings the device to an operational state, while FALSE disables the device. For example, if a scanner Control is disabled, then the device will be physically disabled (when possible). Whether physically disabled or not, any input from the device will be discarded until the device is enabled.

After the application has finished using the device, the **Close** method should be called to release the device and associated resources. If the **DeviceEnabled** property is TRUE, then **Close** disables the device. If the **Claimed** property is TRUE, then **Close** releases the lock. Before exiting, an application should close all open OPOS Controls.

In summary, the application follows this general sequence:

- **Open** method: Call to link the Control Object to the Service Object.
- **ClaimDevice** method: Call to gain exclusive access to the device. Required for exclusive-use devices; optional for some sharable devices. (See “Device Sharing Model”, page 20 for more information).
- **DeviceEnabled** property: Set to TRUE to make the device operational. (For sharable devices, the device may be enabled without first claiming it.)
- *Use the device.*
- **DeviceEnabled** property: Set to FALSE to disable the device.
- **ReleaseDevice** method: Call to release exclusive access to the device.
- **Close** method: Call to release the Service Object from the Control Object.

When Methods and Properties May Be Accessed

Methods

Before a successful **Open**, no other methods may be invoked. Doing so will do nothing but return a status of OPOS_E_CLOSED.

Exclusive-use devices require the application to call the **ClaimDevice** method and to set the **DeviceEnabled** property to TRUE before most other methods may be called.

Sharable devices require the application to set the **DeviceEnabled** property to TRUE before most other methods may be called.

The “Summary” section of each device class’ chapter should be consulted for the specific prerequisites for each method.

Properties

Before a successful **Open**, the values of most properties are not initialized. An attempt to set writable properties will be ignored.

The following properties are always initialized:

<i>Property</i>	<i>Value</i>
State	OPOS_S_CLOSED
ResultCode	OPOS_E_CLOSED
ControlObjectDescription	Control Object dependent string.
ControlObjectVersion	Control Object dependent number.

Capability properties are initialized after the **Open** is successfully called.

Exclusive use devices require the application to call the **ClaimDevice** method and to set the **DeviceEnabled** property to TRUE before some other properties are initialized or may be written.

Sharable devices require the application to set the **DeviceEnabled** property to TRUE before some other properties are initialized or may be written.

To determine when a property is initialized or writable, refer to the Summary section of each device class plus the property's Remarks section.

Setting writable properties before the prerequisites are met will cause the write to be ignored, and will set the **ResultCode** property to either OPOS_E_NOTCLAIMED or OPOS_E_DISABLED.

Reading an uninitialized property returns the following values, unless otherwise specified in the device class documentation:

<i>Property Type</i>	Value
<i>Boolean</i>	FALSE
<i>Long</i>	0
<i>String</i>	"[Error]" – include the brackets.

After properties have been initialized, subsequent claims and enables do not reinitialize the properties. They remain initialized until the **Close** method is called.

Status, Result Code, and State Model

The status, result code, and state models are built around several common properties, events, and methods, described in the following table, and are supported by additional class-specific components.

Name	Meaning
State	A property containing the current state of the Control: OPOS_S_CLOSED OPOS_S_IDLE OPOS_S_BUSY OPOS_S_ERROR
ResultCode	A property containing the status of the most recent method or the most recently changed writable property: OPOS_SUCCESS OPOS_E_CLOSED OPOS_E_CLAIMED OPOS_E_NOTCLAIMED OPOS_E_NOSERVICE OPOS_E_DISABLED OPOS_E_ILLEGAL OPOS_E_NOHARDWARE OPOS_E_OFFLINE OPOS_E_NOEXIST OPOS_E_EXISTS OPOS_E_FAILURE OPOS_E_TIMEOUT OPOS_E_BUSY OPOS_E_EXTENDED
ResultCodeExtended	A property containing the extended status of the most recent method or the most recently changed writable property. Value varies by ResultCode and by device class.
StatusUpdateEvent	An event fired when some class-specific state or status variable has changed. Release 1.3 and later: All devices may be able to report device power state. See “Device Power Reporting Model” on page 28.
ErrorEvent	An event fired when the State is changed to Error.

Status Model

The rules of the status model are as follows:

- The only aspect of the status model that is common to all device classes is the means of alerting the application, which is through the firing of the **StatusUpdateEvent**.
- Each device class specifies the status changes that cause it to fire the event. Examples of device class-specific status changes are:
 - ♦ A change in the cash drawer position (for example, a transition from open to closed).
 - ♦ A change in a POS printer sensor (for example, activation of a “form present” sensor, indicating that a slip has been inserted).

Result Code Model

The rules of the result code model are as follows:

- Every method returns a result code. This code is also placed into **ResultCode**.
- Setting a writable property causes a result code to be placed into **ResultCode**.
- The **ResultCode** OPOS_SUCCESS is assigned the value of zero. Non-zero values indicate an error or warning.
- The Control must select one of the result codes listed on page 55. If the Control sets **ResultCode** to OPOS_E_EXTENDED, then it must set **ResultCodeExtended** to one of the values specified in the device class documentation. (That is, when this **ResultCode** value is selected, then **ResultCodeExtended** may only contain one of the values listed in this document for the device class, in the appropriate method or property section.)

If the Control sets **ResultCode** to a value other than OPOS_E_EXTENDED, then the Service Object may set the **ResultCodeExtended** property to any SO-specific value. If an application uses these values, it will, of course, need to add Service Object-specific code. (If the application needs to add such code, then the **ServiceObjectDescription**, **DeviceDescription**, or **DeviceName** property may be interrogated to determine the Service Object with which it is dealing.)

State Model

The rules of the state model are as follows:

- The Control's **State** is initially OPOS_S_CLOSED.
- The **State** is changed to OPOS_S_IDLE when the **Open** method is called and its result is OPOS_SUCCESS.
- The **State** is set to OPOS_S_BUSY when OPOS is processing output. The **State** is restored to OPOS_S_IDLE when these complete successfully.
- The **State** is changed to OPOS_S_ERROR when:
 - ◆ An asynchronous output encounters an error condition.
 - ◆ An error is encountered during the gathering or processing of event-driven input.

After OPOS changes the **State** property to OPOS_S_ERROR, it invokes **ErrorEvent**. The parameters to this event are the result code and extended result code, the locus of the error, and a pointer to the application's response to the error. The locus can indicate one of three error locations:

- ◆ Output – The error occurred while processing previously queued output.
- ◆ InputWithData – The error occurred while gathering or processing event-driven input. Some previously gathered input data is available for the application. When this error locus is given, then the application can continue to process input until a second **ErrorEvent** is received with the InputNoData locus, or it can clear the input.
- ◆ InputNoData – The error occurred while gathering or processing event-driven input, and either all previously gathered input data has been processed or there is no input data available.

When the application returns from the **ErrorEvent**, it may change the response parameter. The response values are:

- ◆ Retry – If the locus is Output: Retry the asynchronous output and exit the error state. If an error occurs while retrying, then another **ErrorEvent** will be generated.
If the locus is Input: Some devices support retrying the input, if retry can be controlled by the Service Object.
“Retry” is the default response when the locus is “Output.”
- ◆ Clear – Clear the asynchronous output or buffered input data and exit the error state.
“Clear” is the default response when the locus is “InputNoData.”

- ◆ Continue – Use only if the locus is InputWithData. This response acknowledges the error and directs the Control to continue processing. The Control remains in the error state, and will deliver additional data events as directed by the **DataEventEnabled** property. When all input has been delivered and the **DataEventEnabled** property is again set to TRUE, then another **ErrorEvent** is delivered with locus “InputNoData.”

“Continue” is the default response when the locus is “InputNoData.”

The Control ensures that while the application is processing an **ErrorEvent**, it will not deliver any other **ErrorEvents**.

Device Sharing Model

The OLE for Retail POS device sharing model supports devices that are to be used exclusively by one application³ at a time, as well as devices that may be partially or fully shared by multiple applications. (See “When Methods and Properties May Be Accessed”, page 14, for other details.) All OPOS Controls may be opened by more than one application at a given time. Some or many of the activities that an application can perform with the Control, however, may be restricted to an application that claims access to the device.

Exclusive-Use Devices

The most common device type is called an “exclusive-use device.” An example is the POS printer. Due to physical or operational characteristics, this device can only be used by one application at a time. The application must call the **ClaimDevice** method to gain exclusive access to the device before most methods, properties, or events are legal. Until the device is claimed, calling methods or setting properties cause an OPOS_E_NOTCLAIMED error, and events are not fired to the application.

Should two closely cooperating applications want to treat an exclusive-use device in a shared manner, then one application may claim the device for a short sequence of operations, then release it so that the other application may use it.

When the **ClaimDevice** method is called again, settable device characteristics are restored to their condition at **ReleaseDevice**. Examples of restored characteristics are the line display’s brightness, the MSR’s tracks to read, and the printer’s characters per line. State characteristics are not restored, such as the printer’s sensor properties. Instead, these are updated to their current values.

Sharable Devices

Some devices are “sharable devices.” An example is the keylock. A sharable device allows multiple applications to call its methods and access its properties. Also, it may fire its events to all applications that have opened it. A sharable device may still limit access to some methods or properties to an application that has claimed it, or may fire some events only to this application.

³ This document assumes that an application consists of only one process. Multi-process applications are possible to create but uncommon. Technically, device sharing is performed on a process basis. However, with single-process applications we can view sharing as application-level.

Note

One might argue that all devices should be defined as sharable to allow maximum flexibility to applications. In practical use, this flexibility is unlikely to be useful. The downside is an implementation that may be significantly more complex and less likely to be accurate.

In the interest of a specification that is both sufficiently robust for application development, plus implementable by hardware manufacturers, this document defines most devices as exclusive-use, and defines as sharable only those devices that have a significant potential for simultaneous use by multiple applications.

Events

OLE for Retail POS uses events to inform an application of various activities or changes with the OPOS Control. The five event types follow. Subsequent sections will clarify their definitions.

- **DataEvent**: Input data has been placed into device class-specific properties.
- **ErrorEvent**: An error has occurred during event-driven input or asynchronous output.
- **StatusUpdateEvent**: Reports a change in the device's status.
- **OutputCompleteEvent**: An asynchronous output has successfully completed.
- **DirectIOEvent**: This event may be defined by a Service Object provider for purposes not covered by the specification.

The Service Object enqueues events as they occur. Often these events will be enqueued by worker threads, rather than the application's thread. Enqueued events are delivered to the application when conditions are correct. Conditions which delay the delivery of events include:

- The application thread is busy processing other messages.
OPOS Controls are to follow the OLE Apartment Threading model. According to OLE Apartment Threading rules, events are to be delivered on the thread that created the COM object, which will usually be the application's main thread. If the application is processing another message, then event delivery must wait until this processing has finished.
- The application has set the property **FreezeEvents** to TRUE. (See page 49.)
- The event type is **DataEvent** or an input **ErrorEvent**, but the property **DataEventEnabled** is FALSE. (See "Input Model" on page 24.)

If the oldest enqueued event is blocked for one of these reasons, then all newer events may also be blocked. That is, the delivery of enqueued events is typically in a strict first in, first out order. Priority is not given to any event types on the queue.

Note – Terminology

The following event terminology is used rather consistently in this document. Some implementations may vary from the model described here, but the net effect is similar:

- **Enqueue:** When the Service Object determines that an event needs to be fired to the Application, it enqueues the event on an internal event queue. Event queuing typically occurs from one or more internal Service Object worker threads.
 - **Deliver:** When the event queue is non-empty and all conditions are met for the top event on the queue, this event is removed from the queue and delivered to the Application. Event delivery is typically managed by a dedicated internal Service Object worker thread. This thread ensures that events are delivered in the context of the thread that created the Control, in order to adhere to the Apartment Threading model.
 - **Fire:** The combination of enqueueing and delivering an event. Sometimes, the term is used more loosely and may only refer to one of these steps. The reader should differentiate these cases by context.
-

Rules on the management of the queue of events are:

- The Control may only enqueue new events while the device is enabled.
- The Control may deliver enqueued events until the application calls the **ReleaseDevice** method (for exclusive-use devices) or the **Close** method (for any device), at which time any remaining events are deleted.
- For input devices, the **ClearInput** method clears data and error events.

While within an event handler, the application may access properties and call methods. However, the application must not call the **ReleaseDevice** or **Close** methods from an event handler, since **ReleaseDevice** may shut down event handling (possibly including a thread that caused the event to be delivered) and **Close** must shut down event handling before returning.

Input Model

The OLE for Retail POS input model supports event-driven input. Event-driven input allows input data to be received after **DeviceEnabled** is set to TRUE. Received data is enqueued as a **DataEvent**, which is delivered to the application when preconditions are correct. If the **AutoDisable** property is TRUE when data is received, then the control will automatically disable itself, setting **DeviceEnabled** to FALSE. This will inhibit the Control from enqueueing further input and, when possible, physically disable the device.

When the application is ready to receive input from the device, it sets the **DataEventEnabled** property to TRUE. Then, when input is received (usually as a result of a hardware interrupt), the Control enqueues and delivers a **DataEvent**. (If input has already been enqueued, the **DataEvent** will be delivered.) This event may include input status information through a numeric parameter. The Control places the input data plus other information as needed into device specific-specific properties just before the event is fired.

Just before delivering this event, the Control disables further data events by setting the **DataEventEnabled** property to FALSE. This causes subsequent input data to be enqueued by the Control while the application processes the current input and associated properties. When the application has finished the current input and is ready for more data, it reenables events by setting **DataEventEnabled** to TRUE.

If the input device is an exclusive-use device, the application must both claim and enable the device before the device begins reading input.

For sharable input devices, one or more applications must open and enable the device before the device begins reading input. An application must call the **ClaimDevice** method to request exclusive access to the device before the Control will send data to it using the **DataEvent**. If event-driven input is received, but no application has claimed the device, then the input is buffered until an application claims the device (and the **DataEventEnabled** property is TRUE). This behavior allows orderly sharing of the device between multiple applications, effectively passing the input focus between them.

If the Control encounters an error while gathering or processing event-driven input, then the Control changes its state to Error, and enqueues one or two **ErrorEvents** to alert the application of the error condition. This event (or events) is not delivered until the **DataEventEnabled** property is TRUE, so that orderly application sequencing occurs. Error events are delivered with the following loci:

- **InputWithData** (OPOS_EL_INPUT_DATA) – Only enqueued if the error occurred while one or more **DataEvents** are enqueued. It is enqueued ahead of all **DataEvents**. (A typical implementation would place it at the head of the event queue.) This event gives the application the ability to immediately clear the input, or to optionally alert the user to the error and process the buffered input.

The latter case may be useful with a Scanner Control: The user can be immediately alerted to the error so that no further items are scanned until the error is resolved. Any previously scanned items can then be successfully processed before error recovery is performed.

- **InputNoData** (OPOS_EL_INPUT) – Delivered when an error has occurred and there is no data available. (A typical implementation would place it at the tail of the event queue.) If some input data was already enqueued when the error occurred, then an **ErrorEvent** with the locus “InputWithData” was enqueued and delivered first, and then this error event is delivered after all **DataEvents** have been fired. (If an “InputWithData” event was delivered and the application event handler responded with a “Clear”, then this “InputNoData” event is not delivered.)

The Control exits the Error state when one of the following occurs:

- The application returns from the **InputNoData ErrorEvent**.
- The application returns from the **InputWithData ErrorEvent** with OPOS_ER_CLEAR.
- The application calls the **ClearInput** method.

For some Controls, the Application must call a method to begin event driven input. After the input is received by the Control, then typically no additional input will be received until the method is called again to reinitiate input. Examples are the MICR and Signature Capture devices. This variation of event driven input is sometimes called “asynchronous input.”

The **DataCount** property may be read to obtain the number of **DataEvents** enqueued by the Control.

All input enqueued by a Control may be deleted by calling the **ClearInput** method. **ClearInput** may be called after **Open** for sharable devices and after **ClaimDevice** for exclusive-use devices.

The general event-driven input model does not specifically rule out the definition of device classes containing methods or properties that return input data directly. Some device classes will define such methods and properties in order to operate in a more intuitive or flexible manner. An example is the Keylock device. This type of input is sometimes called “synchronous input.”

Output Model

The OLE for Retail POS output model consists of two output types: synchronous and asynchronous. A device class may support one or both types, or neither type.

Synchronous Output

This type of output is preferred when device output can be performed quickly. Its merit is simplicity.

The application calls a class-specific method to perform output. The Control does not return until the output is completed.

Asynchronous Output

This type of output is preferred when device output requires slow hardware interactions. Its merit is perceived responsiveness, since the application can perform other work while the device is performing the output.

The application calls a class-specific method to start the output. The Control buffers the request, sets the **OutputID** property to an identifier for this request, and returns as soon as possible. When the device completes the request successfully, OPOS fires an **OutputCompleteEvent**. A parameter of this event contains the **OutputID** of the completed request.

If an error occurs while performing an asynchronous request, an **ErrorEvent** is fired. The application's event handler can either retry the outstanding output or clear it. The Control is in the Error state while the **ErrorEvent** is in progress. (Note that if the condition causing the error was not corrected, then the Control may immediately reenter the Error state and fire another **ErrorEvent**.)

Asynchronous output is performed on a first-in first-out basis.

All output buffered by the Control may be deleted by calling the **ClearOutput** method. **OutputCompleteEvents** will not be fired for cleared output. This method also stops any output that may be in progress (when possible).

Device Power Reporting Model

Added in OPOS Release 1.3.

Applications frequently need to know the power state of the devices they use. Earlier versions of OPOS had no consistent method for reporting this information. **Note:** This model is not intended to report PC or POS Terminal power conditions (such as “on battery” and “battery low”). Reporting of these conditions is left to PC power management standards and APIs.

Model

OPOS segments device power into three states:

- **ONLINE:** The device is powered on and ready for use. This is the “operational” state.
- **OFF:** The device is powered off or detached from the terminal. This is a “non-operational” state.
- **OFFLINE:** The device is powered on but is either not ready or not able to respond to requests. It may need to be placed online by pressing a button, or it may not be responding to terminal requests. This is a “non-operational” state.

In addition, one combination state is defined:

- **OFF_OFFLINE:** The device is either off or offline, and the Service Object cannot distinguish these states.

Power reporting only occurs while the device is open, claimed (if the device is exclusive-use), and enabled.

Note – Enabled/Disabled vs. Power States

These states are different and usually independent. OPOS defines “disabled” / “enabled” as a logical state, whereas the power state is a physical state. A device may be logically “enabled” but physically “offline”. It may also be logically “disabled” but physically “online”. Regardless of the physical power state, OPOS only reports the state while the device is enabled. (This restriction is necessary because a Service Object typically can only communicate with the device while enabled.)

If a device is “offline”, then a Service Object may choose to fail an attempt to “enable” the device. However, once enabled, the Service Object may not disable a device based on its power state.

Properties

The OPOS device power reporting model adds the following common elements across all device classes:

- **CapPowerReporting** property: Identifies the reporting capabilities of the device. This property may be one of:
 - ◆ OPOS_PR_NONE: The Service Object cannot determine the state of the device. Therefore, no power reporting is possible.
 - ◆ OPOS_PR_STANDARD: The Service Object can determine and report two of the power states – OFF_OFFLINE (that is, off or offline) and ONLINE.
 - ◆ OPOS_PR_ADVANCED: The Service Object can determine and report all three power states – ONLINE, OFFLINE, and OFF.
- **PowerState** property: Maintained by the Service Object at the current power condition, if it can be determined. This property may be one of:
 - ◆ OPOS_PS_UNKNOWN
 - ◆ OPOS_PS_ONLINE
 - ◆ OPOS_PS_OFF
 - ◆ OPOS_PS_OFFLINE
 - ◆ OPOS_PS_OFF_OFFLINE
- **PowerNotify** property: The Application may set this property to enable power reporting via **StatusUpdateEvents** and the **PowerState** property. This property may only be set before the device is enabled (that is, before **DeviceEnabled** is set to TRUE). This restriction allows simpler implementation of power notification with no adverse effects on the application. The application is either prepared to receive notifications or does not want them, and has no need to switch between these cases. This property may be one of:
 - ◆ OPOS_PN_DISABLED
 - ◆ OPOS_PN_ENABLED

Power Reporting Requirements for DeviceEnabled

The following semantics are added to **DeviceEnabled** when **CapPowerReporting** is not OPOS_PR_NONE, and **PowerNotify** is OPOS_PN_ENABLED:

- When the Control changes from **DeviceEnabled** FALSE to TRUE, then begin monitoring the power state:
 - ◆ If the device is ONLINE, then:
 - **PowerState** is set to OPOS_PS_ONLINE.
 - A **StatusUpdateEvent** is fired with *Status* parameter set to OPOS_SUE_POWER_ONLINE.
 - ◆ If the device power state is OFF, OFFLINE, or OFF_OFFLINE, then the Control may choose to fail the enable, setting **ResultCode** to OPOS_E_NOHARDWARE or OPOS_E_OFFLINE.

However, if there are no other conditions that cause the enable to fail, and the Control chooses to return success for the enable, then:

 - **PowerState** is set to OPOS_PS_OFF, OPOS_PS_OFFLINE, or OPOS_PS_OFF_OFFLINE.
 - A **StatusUpdateEvent** is fired with *Status* parameter set to OPOS_SUE_POWER_OFF, OPOS_SUE_POWER_OFFLINE, or OPOS_SUE_POWER_OFF_OFFLINE.
- When the Control changes from **DeviceEnabled** TRUE to FALSE, then OPOS assumes that the Control is no longer monitoring the power state. Therefore: **PowerState** is set to OPOS_PS_UNKNOWN.

OPOS Control Descriptions

Chapter Layout

Chapter 1 provides interface descriptions for the common properties, events, and methods.

The following chapters provide interface descriptions for the following OLE for Retail POS OLE Controls:

- Bump Bar ***Added in Release 1.3***
- Cash Changer ***Added in Release 1.2***
- Cash Drawer
- Credit Authorization Terminal (CAT) ***Added in Release 1.4***
- Coin Dispenser (Largely superseded by the Cash Changer in Release 1.2)
- Fiscal Printer ***Added in Release 1.3***
- Line Display
- Hard Totals
- Keylock
- Magnetic Ink Character Recognition (MICR) Reader
- Magnetic Stripe Reader (MSR)
- PIN Pad ***Added in Release 1.3***
- Point Card Reader Writer ***Added in Release 1.5***
- POS Keyboard ***Added in Release 1.1***
- POS Power ***Added in Release 1.5***
- POS Printer
- Remote Order Display ***Added in Release 1.3***
- Scale
- Scanner – Bar Code Reader
- Signature Capture
- Tone Indicator ***Added in Release 1.2***

Appendix A provides a history of changes to this document.

Appendix B details the OPOS use of the system registry.

Appendix C contains the OPOS application header files.

Appendix D gives miscellaneous additional technical information.
Appendix E provides information on **ClaimDevice** and **ReleaseDevice**.

Data Types

The parameter and return types specified in the descriptions are as follows:

Type	Meaning
BOOL	<p>An integer with the legal values TRUE (non-zero) and FALSE (zero).</p> <p>COM IDL type: VARIANT_BOOL (short). Values VARIANT_TRUE (-1) and VARIANT_FALSE (0).</p> <p>VARIANT type: VT_BOOL</p>
BSTR	<p>A character string. Consists of a length component followed by the string and a terminating NUL (0) character. See “System Strings (BSTR)” (page 919) for more information.</p> <p>COM IDL type: BSTR (unsigned short*)</p> <p>VARIANT type: VT_BSTR</p>
BSTR*	<p>A pointer to a character string.</p> <p>COM IDL type: BSTR* (unsigned short**)</p> <p>VARIANT type: VT_BYREF VT_BSTR</p>
LONG	<p>An integer with a size of 32 bits.</p> <p>COM IDL type: long</p> <p>VARIANT type: VT_I4</p>
LONG*	<p>A pointer to a 32-bit integer.</p> <p>COM IDL type: long*</p> <p>VARIANT type: VT_BYREF VT_I4</p>

CURRENCY**Release 1.3 and later**

A monetary value. An integer with a size of 64 bits. The value assumes four decimal places. For example, if the integer is “1234567”, then the value is “123.4567”.

COM IDL type: CURRENCY (union tagCY)

“union tagCY” is declared as

```
{  
    struct { long Hi; long Lo; };  
    __int64 int64;  
};
```

VARIANT type: VT_CY

CURRENCY***Release 1.3 and later**

A pointer to a CURRENCY value.

COM IDL type: CURRENCY* (union tagCY*)

VARIANT type: VT_BYREF | VT_CY

CHAPTER 1

Common Properties, Methods, and Events

Summary

Properties

<i>Name</i>	<i>Ver</i>	<i>Type</i>	<i>Access</i>
AutoDisable	1.2	Boolean	R/W
BinaryConversion	1.2	Long	R/W
CapPowerReporting	1.3	Long	R
CheckHealthText	1.0	String	R
Claimed	1.0	Boolean	R
DataCount	1.2	Long	R
DataEventEnabled	1.0	Boolean	R/W
DeviceEnabled	1.0	Boolean	R/W
FreezeEvents	1.0	Boolean	R/W
OpenResult	1.5	Long	R
OutputID	1.0	Long	R
PowerNotify	1.3	Long	R/W
PowerState	1.3	Long	R
ResultCode	1.0	Long	R
ResultCodeExtended	1.0	Long	R
State	1.0	Long	R
ControlObjectDescription	1.0	String	R
ControlObjectVersion	1.0	Long	R
ServiceObjectDescription	1.0	String	R
ServiceObjectVersion	1.0	Long	R
DeviceDescription	1.0	String	R
DeviceName	1.0	String	R

Methods

<i>Name</i>	<i>Ver</i>
Open	1.0
Close	1.0
ClaimDevice	1.0
ReleaseDevice	1.0
CheckHealth	1.0
ClearInput	1.0
ClearOutput	1.0
DirectIO	1.0

Events

<i>Name</i>	<i>Ver</i>
DataEvent	1.0
DirectIOEvent	1.0
ErrorEvent	1.0
OutputCompleteEvent	1.0
StatusUpdateEvent	1.0

General Information

This section lists properties, events, and methods that are common to many of the subsequent device categories.

The summary section of each device class marks those common properties, events, and methods that do not apply to that class as “Not Supported.” These are not present in the class’ controls.

Properties

AutoDisable Property R/W

Added in Release 1.2

Syntax **BOOL AutoDisable;**

Remarks This property applies to event-driven input devices. It provides the application with an additional option for controlling the receipt of input data. If an application wants to receive and process only one input, or only one input at a time, then this property may be set to TRUE.

When TRUE, then as soon as the Service Object receives and enqueues data to be fired as a **DataEvent**, then it sets **DeviceEnabled** = FALSE. Before any additional input can be received, the application must set **DeviceEnabled** = TRUE.

When FALSE, the Service Object does not automatically disable the device when data is received. This is the behavior of OPOS controls prior to Release 1.2.

This property is initialized to FALSE by the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
-------	---------

OPOS_SUCCESS	The property was set successfully.
--------------	------------------------------------

See Also “Input Model”

BinaryConversion Property R/W *Added in Release 1.2*

Syntax **LONG BinaryConversion;**

Remarks OPOS passes multicharacter input and output using BStrings. BStrings may be safely used for text data. As the BStrings are passed between the application and the OPOS Control, OLE may perform language-specific translations to or from Unicode.

When BStrings are used to pass binary data, then these translations may alter the data such that the data byte in a BString character at the application does not match the corresponding byte at the Control. This mismatch is more likely when BString pointers are used, since the Unicode characters are presented to the application and/or Control, and a language difference between them may cause misinterpretation. (This was first reported with Japanese, which uses the MBCS Code Page 932, but can occur with other languages, also.)

Characters between 0x00 and 0x7F may be sent without fear of language-specific translation. Only characters between 0x80 and 0xFF sometimes cause incorrect translations.

This document specifies those properties and method parameters that are affected by **BinaryConversion** in the individual property and method descriptions. The following line is added to their description:

The format of this data depends upon the value of the **BinaryConversion** property. See page 39.

The binary conversion values are:

Value	Meaning
OPOS_BC_NONE	Data is placed one byte per BString character, with no conversion. (This is the default, and is the behavior of OPOS Service Objects prior to 1.2.)
OPOS_BC_NIBBLE	Each byte is converted into two characters. (This option provides for the fastest conversion between binary and ASCII characters.) Each data byte is converted as follows: First character = 0x30 + bits 7-4 of the data byte. Second character = 0x30 + bits 3-0 of the data byte.

Example: Byte value 154 = 0x9A is converted into the characters 0x39 0x3A (= the string "9:"). Note that this conversion is not the more common hexadecimal ASCII, which would have converted 154 to 0x39 0x41 (= the string "9A").

OPOS_BC_DECIMAL Each byte is converted into three characters. (This option provides for the easiest conversion between binary and ASCII characters for Visual Basic and similar languages.)

VAL(*string*) may be used on each 3 characters to convert from ASCII to binary.

RIGHT("^^"+STR(*byte*), 3) may be used to produce 3 ASCII characters from each byte, where '^' represents the space character.

Example 1: Byte value 154 = 0x9A becomes the characters 0x31 0x35 0x34 (= the string "154").

Example 2: Byte value 8 becomes the characters 0x30 0x30 0x38 (= the string "008").

Requirements for a Service Object are:

(1) When the Service Object converts from ASCII to binary, it must allow either leading spaces or ASCII zeroes, since STR(*byte*) produces a leading space. (For example, the application may pass "^^8^27", where '^' represents the space character, which will be interpreted as the two bytes 8 (0x08) and 27 (0x1B).)

(2) When the Service Object converts from binary to ASCII, it must always convert each byte into exactly three ASCII decimal characters (range 0x30 to 0x39).

When **BinaryConversion** is on (that is, not OPOS_BC_NONE) and the property or method parameter description specifies that **BinaryConversion** applies, then the application has the following responsibilities:

- Before setting the property or passing the method parameter, convert the string data into the format specified by the **BinaryConversion** value.
- After getting the property or receiving the method parameter, convert the string data from the format specified by the **BinaryConversion** value.

To better understand the “direction” of the conversion, determine if the data flow follows the Output Model or the Input Model. If the flow follows the Output Model, then the application must adhere to the first responsibility listed above. If the flow follows the Input Model, then the application must adhere to the second responsibility listed above.

This property is initialized to OPOS_BC_NONE by the **Open** method.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An illegal value was specified.

CapPowerReporting Property *Added in Release 1.3*

Syntax LONG CapPowerReporting;

Remarks Identifies the reporting capabilities of the device.

The power reporting values are:

Value	Meaning
OPOS_PR_NONE	The Service Object cannot determine the state of the device. Therefore, no power reporting is possible.
OPOS_PR_STANDARD	The Service Object can determine and report two of the power states – OFF_OFFLINE (that is, off or offline) and ONLINE.
OPOS_PR_ADVANCED	The Service Object can determine and report all three power states – OFF, OFFLINE, and ONLINE.

This property is initialized by the **Open** method.

See Also “Device Power Reporting Model”; **PowerState** Property, **PowerNotify** Property

CheckHealthText Property

Syntax	BSTR CheckHealthText;
Remarks	<p>Holds the results of the most recent call to the CheckHealth method. The following examples illustrate some possible diagnoses:</p> <ul style="list-style-type: none">• “Internal HCheck: Successful”• “External HCheck: Not Responding”• “Interactive HCheck: Complete” <p>Before the first CheckHealth method call, its value is uninitialized.</p>
See Also	CheckHealth Method

Claimed Property

Syntax	BOOL Claimed;
Remarks	<p>If TRUE, the device is claimed for exclusive access. If FALSE, the device is released for sharing with other applications.</p> <p>Many devices must be claimed before the Control will allow access to many of its methods and properties, and before it will fire events to the application.</p> <p>The value of Claimed is initialized to FALSE by the Open method.</p>
See Also	“General OLE for Retail POS Control Model”; “Device Sharing Model”; ClaimDevice Method; ReleaseDevice Method

ControlObjectDescription Property

Syntax **BSTR ControlObjectDescription;**

Remarks String identifying the Control Object and the company that produced it.

The property identifies the Control Object. A sample returned string is:

 "POS Printer OLE Control, (C) 1995 Epson"

This property is always readable.

See Also **ControlObjectVersion** Property

ControlObjectVersion Property

Syntax **LONG ControlObjectVersion;**

Remarks Control Object version number.

This property holds the Control Object version number. Three version levels are specified, as follows:

Version Level	Description
Major	The “millions” place. A change to the OPOS major version level for a device class reflects significant interface enhancements, and may remove support for obsolete interfaces from previous major version levels.
Minor	The “thousands” place. A change to the OPOS minor version level for a device class reflects minor interface enhancements, and must provide a superset of previous interfaces at this major version level.
Build	The “units” place. Internal level provided by the Control Object developer. Updated when corrections are made to the CO implementation.

A sample version number is:

1002038

This value may be displayed as version “1.2.38”, and interpreted as major version 1, minor version 2, build 38 of the Control Object.

This property is always readable.

See Also **ControlObjectDescription** Property

Note

A Control Object for a device class will operate with any Service Object for that class, as long as its major version number matches the Service Object's major version number. If they match, but the Control Object's minor version number is greater than the Service Object's minor version number, then the Control Object may support some new methods or properties that are not supported by the Service Object's release.

The following rules apply to APIs supported by the Control Object's release but not supported by the Service Object's older release:

- Reading an unsupported property: The Control Object returns the property's uninitialized value. (See page 14 for uninitialized property default values.)
 - Writing an unsupported property: The Control Object returns, but must remember that an unsupported property write or method call occurred. Then, if the application reads the **ResultCode** property, the Control Object must return a value of OPOS_E_NOSERVICE (rather than reading the current **ResultCode** from the Service Object). It must do this until the next property write or method call, at which time **ResultCode** is set by that API.
 - Calling an unsupported method: The Control Object returns a value of OPOS_E_NOSERVICE, and must remember that an unsupported property write or method call occurred. Then, if the application reads the **ResultCode** property, the Control Object must return a value of OPOS_E_NOSERVICE (rather than reading the current **ResultCode** from the Service Object). It must do this until the next property write or method call, at which time **ResultCode** is set by that API.
-

DataCount Property***Added in Release 1.2***

Syntax **LONG DataCount;**

Remarks Holds the number of enqueued **DataEvents** at the control.

The application may interrogate **DataCount** to determine whether additional input is enqueued from a device, but has not yet been delivered because of other application processing, freezing of events, or other causes.

This property is initialized to zero by the **Open** method.

See Also "Input Model"; **DataEvent**

DataEventEnabled Property R/W

Syntax **BOOL DataEventEnabled;**

Remarks When TRUE, a **DataEvent** will be delivered as soon as input data is enqueued. If changed to TRUE and some input data is already queued, then a **DataEvent** is delivered immediately. (Note that other, less likely, conditions may delay “immediate” delivery: If **FreezeEvents** is TRUE or another event is already being processed at the application, the **DataEvent** will remain enqueued at the Service Object until the condition is corrected.)

When FALSE, input data is queued for later delivery to the application. Also, if an input error occurs, the **ErrorEvent** is not delivered while **DataEventEnabled** is FALSE.

This property is initialized to FALSE by the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.

See Also “Input Model”; **DataEvent**

DeviceDescription Property

Syntax **BSTR DeviceDescription;**

Remarks String identifying the device.

The property identifies the device and any pertinent information about it. A sample returned string is:

“NCR 7192-0184 Printer, Japanese Version”

This property is initialized by the **Open** method.

See Also **DeviceName** Property

DeviceEnabled Property R/W

Syntax **BOOL DeviceEnabled;**

Remarks When TRUE, the device has been placed in an operational state. If changed to TRUE, then the device is brought to an operational state.

When FALSE, the device has been disabled. If changed to FALSE, then the device is physically disabled when possible, any subsequent input will be discarded, and output operations are disallowed.

Changing this property usually does not physically affect output devices. For consistency, however, the application must set this property to TRUE before using output devices.

Release 1.3 and later: The device's power state may be reported while **DeviceEnabled** is TRUE. See "Device Power Reporting Model" for details.

This property is initialized to FALSE by the **Open** method.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_NOTCLAIMED	An exclusive use device must be claimed before the device may be enabled.
<i>Other Values</i>	See ResultCode .

See Also "General OLE for Retail POS Control Model"

DeviceName Property

Syntax **BSTR DeviceName;**

Remarks Short string identifying the device.

The property identifies the device and any pertinent information about it. This is a short version of **DeviceDescription** and should be limited to 30 characters.

DeviceName will typically be used to identify the device in an application message box, where the full description is too verbose. A sample returned string is:

`"NCR 7192 Printer, Japanese"`

This property is initialized by the **Open** method.

See Also **DeviceDescription** Property

FreezeEvents Property R/W

Syntax **BOOL FreezeEvents;**

Remarks When TRUE, the application has requested that the Control not deliver events. Events will be held by the Control until events are unfrozen.

When FALSE, the application allows events to be delivered. If some events have been held while events were frozen and all other conditions are correct for delivering the events, then changing **FreezeEvents** to FALSE will cause these events to be delivered.⁴

An application may choose to freeze events for a specific sequence of code where interruption by an event is not desirable.

This property is initialized to FALSE by the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.

⁴ Firing of events can also be deferred by the containing application. A control container may request controls to freeze event firing. For example, this feature is utilized by Visual Basic when modal dialog boxes are active. Therefore, events are fired when both **FreezeEvents** is FALSE and the container has not requested event freezing.

Container-initiated event freezing is not referenced elsewhere in this document, since an Application will seldom if ever notice it and cannot directly control it.

Other conditions are described in the section "Events" on page 22.

OpenResult Property***Added in Release 1.5*****Syntax** **LONG OpenResult;****Remarks** Holds additional details about the most recent **Open** method.

The open result values are:

Value	Meaning
OPOS_SUCCESS	Successful open.
OPOS_OR_ALREADYOPEN	Control already open.
OPOS_OR_REGBADNAME	The registry does not contain a key for the specified device name.
OPOS_OR_REGPROGID	Could not read the device name key's default value, or could not convert the Programmatic ID it holds into a valid Class ID.
OPOS_OR_CREATE	Could not create a service object instance, or could not get its IDispatch interface.
OPOS_OR_BADIF	The service object does not support one or more of the methods required by its release.
OPOS_OR_FAILEDOPEN	The service object returned a failure status from its open call, but does not have a more specific failure code.
OPOS_OR_BADVERSION	The service object major version number does not match the control object major version number.

The following values can be returned by the Service Object if it returns a failure status from its open call. The Service Object can choose to return one of these, if applicable, or define additional values. (See the Control Programmer's Guide's GetOpenResult description for details on how the Service Object returns these values. If the Service Object does not implement GetOpenResult, then OpenResult returns OPOS_OR_FAILEDOPEN.)

OPOS_ORS_NOPORT The Service Object tried to access an I/O port (for example, an RS232 port) during Open processing, but the port that is configured for the DeviceName is invalid or inaccessible.

As a general rule, an SO should refrain from accessing the physical device until the DeviceEnabled property is set to TRUE. But in some cases, it may require some access at Open; for instance, to dynamically determining the device type in order to set the DeviceName and DeviceDescription properties.

OPOS_ORS_NOTSUPPORTED

The Service Object does not support the specified device.

The SO has determined that it does not have the ability to control the device it is opening. This determination may be due to an inspection of the registry entries for the device, or dynamic querying of the device during open processing.

OPOS_ORS_CONFIG Configuration information error.

Usually this is due to incomplete configuration of the registry, such that the SO does not have sufficient or valid data to open the device.

OPOS_ORS_SPECIFIC Errors greater than this value are service object-specific.

If the previous return values do not apply, then the SO may define additional OpenResult values. These values are Service Object-specific, but may be of value in these cases:

- 1) The Application logs or reports this error during debug and testing.
- 2) The Application adds SO-specific logic, to attempt to report more error conditions or to recover from them.

This property is initialized by the **Open** method.

OutputID Property

Syntax	LONG OutputID;
Remarks	<p>Holds the identifier of the most recently started asynchronous output.</p> <p>When a method successfully initiates an asynchronous output, the Control assigns an identifier to the request. When the output completes, the Control will fire an OutputCompleteEvent passing this output ID as a parameter.</p> <p>The output ID numbers are assigned by the Control and are guaranteed to be unique among the set of outstanding asynchronous outputs. No other facts about the ID should be assumed.</p>
See Also	“Output Model”; OutputCompleteEvent

PowerNotify Property R/W *Added in Release 1.3***Syntax** LONG PowerNotify;**Remarks** Contains the type power notification selection made by the Application.

The power notification values are:

Value	Meaning
OPOS_PN_DISABLED	The Control will not provide any power notifications to the application. No power notification StatusUpdateEvents will be fired, and PowerState may not be set.
OPOS_PN_ENABLED	The Control will fire power notification StatusUpdateEvents and update PowerState , beginning when DeviceEnabled is set to TRUE. The level of functionality depends upon CapPowerReporting .

PowerNotify may only be set while the device is disabled, that is, while **DeviceEnabled** is FALSE.

This property is initialized to OPOS_PN_DISABLED by the **Open** method. This value provides compatibility with earlier releases.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	One of the following occurred: <ul style="list-style-type: none"> The device is already enabled. PowerNotify = OPOS_PN_ENABLED but CapPowerReporting = OPOS_PR_NONE.
<i>Other Values</i>	See ResultCode .

See Also “Device Power Reporting Model”; **CapPowerReporting** Property, **PowerState** Property

PowerState Property***Added in Release 1.3*****Syntax** **LONG PowerState;****Remarks** Contains the current power condition, if it can be determined.

The power reporting values are:

Value	Meaning
OPOS_PS_UNKNOWN	Cannot determine the device's power state, for one of the following reasons: <ul style="list-style-type: none"> • CapPowerReporting = OPOS_PR_NONE. Device does not support power reporting. • PowerNotify = OPOS_PN_DISABLED. Power notifications are disabled. • DeviceEnabled = FALSE. Power state monitoring does not occur until the device is enabled.
OPOS_PS_ONLINE	The device is powered on and ready for use. Can be returned if CapPowerReporting = OPOS_PR_STANDARD or OPOS_PR_ADVANCED.
OPOS_PS_OFF	The device is off or detached from the terminal. Can only be returned if CapPowerReporting = OPOS_PR_ADVANCED.
OPOS_PS_OFFLINE	The device is powered on but is either not ready or not able to respond to requests. Can only be returned if CapPowerReporting = OPOS_PR_ADVANCED.
OPOS_PS_OFF_OFFLINE	The device is either off or offline. Can only be returned if CapPowerReporting = OPOS_PR_STANDARD.

This property is initialized to OPOS_PS_UNKNOWN by the **Open** method. When **PowerNotify** is set to enabled and **DeviceEnabled** is TRUE, then this property is updated as the Service Object detects power condition changes.

See Also “Device Power Reporting Model”; **CapPowerReporting** Property, **PowerNotify** Property

ResultCode Property

Syntax **LONG ResultCode;**

Remarks This property is set by each method. It is also set when a writable property is set.

This property is always readable. Before the **Open** method is called, it returns the value OPOS_E_CLOSED.

It is conceivable that more than one of the following result codes could be valid for a particular failure. The order of error reporting precedence for such scenarios is the following:

- OPOS_E_CLAIMED
- OPOS_E_NOTCLAIMED
- OPOS_E_DISABLED

The result code values are:

Value	Meaning
OPOS_SUCCESS	Successful operation.
OPOS_E_CLOSED	Attempt was made to access a closed device.
OPOS_E_CLAIMED	Attempt was made to access a device that is claimed by another process. The other process must release the device before this access may be made. For exclusive-use devices, the application will also need to claim the device before the access is legal.
OPOS_E_NOTCLAIMED	Attempt was made to access an exclusive-use device that must be claimed before the method or property set action can be used. If the device is already claimed by another process, then the status OPOS_E_CLAIMED is returned instead.
OPOS_E_NOSERVICE	The Control cannot communicate with the Service Object. Most likely, a setup or configuration error must be corrected.
OPOS_E_DISABLED	Cannot perform operation while device is disabled.

OPOS_E_ILLEGAL	Attempt was made to perform an illegal or unsupported operation with the device, or an invalid parameter value was used.
OPOS_E_NOHARDWARE	The device is not connected to the system or is not powered on.
OPOS_E_OFFLINE	The device is off-line.
OPOS_E_NOEXIST	The file name (or other specified value) does not exist.
OPOS_E_EXISTS	The file name (or other specified value) already exists.
OPOS_E_FAILURE	The device cannot perform the requested procedure, even though the device is connected to the system, powered on, and on-line.
OPOS_E_TIMEOUT	The Service Object timed out waiting for a response from the device, or the Control timed out waiting for a response from the Service Object.
OPOS_E_BUSY	The current Service Object state does not allow this request. For example, if asynchronous output is in progress, certain methods may not be allowed.
OPOS_E_EXTENDED	A class-specific error condition occurred. The error condition code is available in the ResultCodeExtended property.

See Also “Status, Result Code, and State Model”

ResultCodeExtended Property

Syntax	LONG ResultCodeExtended;
Remarks	<p>When the ResultCode is set to OPOS_E_EXTENDED, this property is set to a class-specific value, and must match one of the values given in this document under the appropriate device class section.</p> <p>When the ResultCode is set to any other value, this property may be set by the Service Object to any SO-specific value. These values are only meaningful if the application adds Service Object-specific code to handle them.</p>
See Also	ResultCode Property

ServiceObjectDescription Property

Syntax	BSTR ServiceObjectDescription;
Remarks	<p>String identifying the Service Object supporting the device and the company that produced it.</p> <p>A sample returned string is:</p> <p style="padding-left: 40px;">"TM-U950 Printer OPOS Service Driver, (C) 1995 Epson"</p> <p>This property is initialized by the Open method.</p>

ServiceObjectVersion Property

Syntax **LONG ServiceObjectVersion;**

Remarks Service object version number.

This property holds the Service Object version number. Three version levels are specified, as follows:

Version Level	Description
Major	The “millions” place. A change to the OPOS major version level for a device class reflects significant interface enhancements, and may remove support for obsolete interfaces from previous major version levels.
Minor	The “thousands” place. A change to the OPOS minor version level for a device class reflects minor interface enhancements, and must provide a superset of previous interfaces at this major version level.
Build	The “units” place. Internal level provided by the Service Object developer. Updated when corrections are made to the SO implementation.

A sample version number is:

1002038

This value may be displayed as version “1.2.38”, and interpreted as major version 1, minor version 2, build 38 of the Service Object.

This property is initialized by the **Open** method.

Note

A Service Object for a device class will operate with any Control Object for that class, as long as its major version number matches the Control Object’s major version number. If they match, but the Service Object’s minor version number is greater than the Control Object’s minor version number, then the Service Object may support some methods or properties that cannot be accessed from the Control Object’s release.

If the application requires such features, then it will need to be updated to use a later version of the Control Object.

State Property

Syntax **LONG State;**

Remarks Contains the current state of the Control.

Value	Meaning
OPOS_S_CLOSED	The Control is closed.
OPOS_S_IDLE	The Control is in a good state and is not busy.
OPOS_S_BUSY	The Control is in a good state and is busy performing output.
OPOS_S_ERROR	An error has been reported, and the application must recover the Control to a good state before normal I/O can resume.

This property is always readable.

See Also “Status, Result Code, and State Model”

Methods

CheckHealth Method

Syntax **LONG CheckHealth (LONG Level);**

The *Level* parameter indicates the type of health check to be performed on the device. The following values may be specified:

Value	Meaning
OPOS_CH_INTERNAL	Perform a health check that does not physically change the device. The device is tested by internal tests to the extent possible.
OPOS_CH_EXTERNAL	Perform a more thorough test that may change the device. For example, a pattern may be printed on the printer.
OPOS_CH_INTERACTIVE	Perform an interactive test of the device. The supporting Service Object will typically display a modal dialog box to present test options and results.

Remarks Called to test the state of a device.

A text description of the results of this method is placed in the **CheckHealthText** property.

The **CheckHealth** method is always synchronous.

Return One of the following values are returned by the method, and also placed in the **ResultCode** property.

Value	Meaning
OPOS_SUCCESS	Indicates that the health checking procedure was initiated properly and, when possible to determine, indicates that the device is healthy. However, the health of many devices can only be determined by a visual inspection of the test results.
OPOS_E_ILLEGAL	The specified health check level is not supported by the Service Object.
OPOS_E_BUSY	Cannot perform while output is in progress.
<i>Other Values</i>	See ResultCode .

See Also “General OLE for Retail POS Control Model”; **CheckHealthText** Property

ClaimDevice Method**Renamed in Release 1.5**

Syntax **LONG ClaimDevice (LONG *Timeout*);**

The *Timeout* parameter gives the maximum number of milliseconds to wait for exclusive access to be satisfied.

If zero, the method attempts to claim the device, then returns the appropriate status immediately.

If OPOS_FOREVER (-1), the method waits as long as needed until exclusive access is satisfied.

Remarks Call this method to request exclusive access to the device. Many devices require an application to claim them before they can be used.

When successful, the **Claimed** property is changed to TRUE.

Release 1.0 – 1.4

In releases prior to 1.5, this method is named **Claim**.

Release 1.5 and later ⁵

ClaimDevice must be used by early-bound applications. For compatibility with late-bound applications, the Control Object's IDispatch interface supports both **ClaimDevice** and **Claim**. It is recommended that applications written to the 1.5 specification use **ClaimDevice**, not **Claim**.

Early bound applications acquire Control Object calling details at development time, including Class IDs, Interface IDs, and method, property, and event calling details. They then can build in static sequences to call methods and properties and receive events. Microsoft Visual C++ and Visual Basic plus most compiled languages support early binding.

Late bound applications acquire calling details at run time. They then dynamically build code sequences to call methods and properties plus receive events. Scripting languages usually support late binding. Late binding can be implemented with many compiled languages, too, but often require additional programmer effort, especially to receive events.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning

⁵ For further details, see “APPENDIX E” on Page 923.

OPOS_SUCCESS	Exclusive access has been granted. The Claimed property is now TRUE. Also returned if this application has already claimed the device.
OPOS_E_ILLEGAL	This device cannot be claimed for exclusive access, or an invalid <i>Timeout</i> parameter was specified.
OPOS_E_TIMEOUT	Another application has exclusive access to the device, and did not relinquish control before <i>Timeout</i> milliseconds expired.

See Also “Device Sharing Model”; **ReleaseDevice** Method

ClearInput Method

Syntax **LONG ClearInput ();**

Remarks Called to clear all device input that has been buffered.

Any data events or input error events that were enqueued – usually waiting for **DataEventEnabled** to be set to TRUE and **FreezeEvents** to be set to FALSE – are also cleared.

Return The following value is returned by the method and placed in the **ResultCode** property.

Value	Meaning
OPOS_SUCCESS	Input has been cleared.
OPOS_E_CLAIMED	The device is claimed by another process.
OPOS_E_NOTCLAIMED	The device must be claimed before this method can be used.

See Also “Input Model”

ClearOutput Method

Syntax **LONG ClearOutput ();**

Remarks Called to clear all device output that has been buffered. Also, when possible, halts outputs that are in progress.

Any output error events that were enqueued – usually waiting for **FreezeEvents** to be set to **FALSE** – are also cleared.

Return The following value is returned by the method and placed in the **ResultCode** property.

Value	Meaning
OPOS_SUCCESS	Output has been cleared.
OPOS_E_CLAIMED	The device is claimed by another process.
OPOS_E_NOTCLAIMED	The device must be claimed before this method can be used.

See Also “Output Model”

Close Method

Syntax **LONG Close ();**

Remarks Called to release the device and its resources.

If the **DeviceEnabled** property is TRUE, then the device is first disabled.

If the **Claimed** property is TRUE, then exclusive access to the device is first released.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	Device has been disabled and closed.
<i>Other Values</i>	See ResultCode .

See Also “General OLE for Retail POS Control Model”; **Open Method**

DirectIO Method

Syntax **LONG DirectIO (LONG *Command*, LONG* *pData*, BSTR* *pString*);**

Parameter	Description
<i>Command</i>	Command number. Specific values assigned by the Service Object.
<i>pData</i>	Pointer to additional numeric data. Specific values vary by <i>Command</i> and Service Object.
<i>pString</i>	Pointer to additional string data. Specific values vary by <i>Command</i> and Service Object. The format of this data depends upon the value of the BinaryConversion property. See page 39.

Remarks Call to communicate directly with the Service Object.

This method provides a means for a Service Object to provide functionality to the application that is not otherwise supported by the standard Control Object for its device class. Depending upon the Service Object's definition of the command, this method may be asynchronous or synchronous.

Use of **DirectIO** will make an application non-portable. The application may, however, maintain portability by performing **DirectIO** calls within conditional code. This code may be based upon the value of the **ServiceObjectDescription**, **DeviceDescription**, or **DeviceName** property.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	Direct I/O successful.
<i>Other Values</i>	See ResultCode .

See Also **DirectIOEvent**

Open Method

Syntax **LONG Open (BSTR DeviceName);**

The *DeviceName* parameter specifies the device name to open.

Remarks Call to open a device for subsequent I/O.

The device name specifies which of one or more devices supported by this Control Object should be used. The *DeviceName* must exist in the system registry for this device class. The relationship between the device name and physical devices is determined by entries within the operating system registry; these entries are maintained by a setup or configuration utility. (See the appendix “APPENDIX B OPOS Registry Usage”, page 869.)

When the **Open** method is successful, it sets the properties **Claimed**, **DeviceEnabled**, **DataEventEnabled**, and **FreezeEvents**, as well as descriptions and version numbers of the OPOS software layers. Additional class-specific properties may also be initialized.

Release 1.5 and later

The value of the **OpenResult** property is set by the **Open** method.

Return One of the following values is returned by the method:

Value	Meaning
OPOS_SUCCESS	Open successful.
OPOS_E_ILLEGAL	The Control is already open.
OPOS_E_NOEXIST	The specified <i>DeviceName</i> was not found.
OPOS_E_NOSERVICE	Could not establish a connection to the corresponding Service Object.
<i>Other Values</i>	See ResultCode .

Note

The value of the **ResultCode** property after calling the **Open** method may not be the same as the **Open** method return value for the following two cases:

1. The Control was closed and the **Open** method failed: The **ResultCode** property will continue to return OPOS_E_CLOSED.
2. The Control was already opened: The **Open** method will return OPOS_E_ILLEGAL, but the **ResultCode** property may continue to return the value it held before the **Open** method.

See Also “General OLE for Retail POS Control Model”; **Close** Method

ReleaseDevice Method***Renamed in Release 1.5*****Syntax** **LONG ReleaseDevice ();****Remarks** Call this method to release exclusive access to the device.

If the **DeviceEnabled** property is TRUE, and the device is an exclusive-use device, then the device is first disabled. (**ReleaseDevice** does not change the device enabled state of sharable devices.)

Release 1.0 – 1.4

In releases prior to 1.5, this method is named **Release**.

Release 1.5 and later ⁶

ReleaseDevice must be used by early-bound applications. For compatibility with late-bound applications, the Control Object's IDispatch interface supports both **ReleaseDevice** and **Release**. It is recommended that applications written to the 1.5 specification use **ReleaseDevice**, not **Release**.

Early bound applications acquire Control Object calling details at development time, including Class IDs, Interface IDs, and method, property, and event calling details. They then can build in static sequences to call methods and properties and receive events. Microsoft Visual C++ and Visual Basic plus most compiled languages support early binding.

Late bound applications acquire calling details at run time. They then dynamically build code sequences to call methods and properties plus receive events. Scripting languages usually support late binding. Late binding can be implemented with many compiled languages, too, but often require additional programmer effort, especially to receive events.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	Exclusive access has been released. The Claimed property is now FALSE.
OPOS_E_ILLEGAL	The application does not have exclusive access to the device.

See Also “Device Sharing Model”; **ClaimDevice** Method

⁶ For further details, see “APPENDIX E” on Page 923.

Events

DataEvent Event

Syntax	void DataEvent (LONG <i>Status</i>); The <i>Status</i> parameter contains the input status. Its value is Control-dependent, and may describe the type or qualities of the input.
Remarks	<p>Fired to present input data from the device to the application. The DataEventEnabled property is changed to FALSE, so that no further data events will be generated until the application sets this property back to TRUE. The actual input data is placed in one or more device-specific properties.</p> <p>If DataEventEnabled is FALSE at the time that data is received, then the data is queued in an internal OPOS buffer, the device-specific input data properties are not updated, and the event is not delivered. (When this property is subsequently changed back to TRUE, the event will be delivered immediately if input data is queued and FreezeEvents is FALSE.)</p>
See Also	“Input Model”; DataEventEnabled Property; FreezeEvents Property

DirectIOEvent Event

Syntax **void DirectIOEvent (LONG *EventNumber*, LONG* *pData*, BSTR* *pString*);**

Parameter	Description
<i>EventNumber</i>	Event number. Specific values are assigned by the Service Object.
<i>pData</i>	Pointer to additional numeric data. Specific values vary by <i>EventNumber</i> and the Service Object.
<i>pString</i>	Pointer to additional string data. Specific values vary by <i>EventNumber</i> and the Service Object. The format of this data depends upon the value of the BinaryConversion property. See page 39.

Remarks Fired by a Service Object to communicate directly with the application.

This event provides a means for a Service Object to provide events to the application that are not otherwise supported by the Control Object.

See Also **DirectIO** Method

ErrorEvent Event

Syntax **void ErrorEvent (LONG ResultCode, LONG ResultCodeExtended, LONG ErrorLocus, LONG* pErrorResponse);**

Parameter	Description
<i>ResultCode</i>	Result code causing the error event. See ResultCode for values.
<i>ResultCodeExtended</i>	Extended result code causing the error event. See ResultCodeExtended for values.
<i>ErrorLocus</i>	Location of the error. See values below.
<i>pErrorResponse</i>	Pointer to the error event response. See values below.

The *ErrorLocus* parameter may be one of the following:

Value	Meaning
OPOS_EL_OUTPUT	Error occurred while processing asynchronous output.
OPOS_EL_INPUT	Error occurred while gathering or processing event-driven input. No input data is available.
OPOS_EL_INPUT_DATA	Error occurred while gathering or processing event-driven input, and some previously buffered data is available.

The contents at the location pointed to by the *pErrorResponse* parameter are preset to a default value, based on the *ErrorLocus*. The application may change them to one of the following:

Value	Meaning
OPOS_ER_RETRY	Typically valid only when locus is OPOS_EL_OUTPUT. Retry the asynchronous output. The error state is exited. May be valid when locus is OPOS_EL_INPUT. Default when locus is OPOS_EL_OUTPUT.
OPOS_ER_CLEAR	Clear the asynchronous output or buffered input data. The error state is exited. Default when locus is OPOS_EL_INPUT.
OPOS_ER_CONTINUEINPUT	Use only when locus is OPOS_EL_INPUT_DATA. Acknowledges the error and directs the Control to continue

processing. The Control remains in the error state and will deliver additional **DataEvents** as directed by the **DataEventEnabled** property. When all input has been delivered and the **DataEventEnabled** property is again set to TRUE, then another **ErrorEvent** is delivered with locus OPOS_EL_INPUT.
Default when locus is OPOS_EL_INPUT_DATA.

- Remarks** Fired when an error is detected and the Control's **State** transitions into the error state.
Input error events are not delivered until the **DataEventEnabled** property is TRUE, so that proper application sequencing occurs.
- See Also** "Status, Result Code, and State Model"

OutputCompleteEvent Event

- Syntax** `void OutputCompleteEvent (LONG OutputID);`
The *OutputID* parameter indicates the ID number of the asynchronous output request that is complete.
- Remarks** Fired when a previously started asynchronous output request completes successfully.
- See Also** "Output Model"

StatusUpdateEvent Event

Syntax **void StatusUpdateEvent (LONG *Status*);**

The *Status* parameter is for device class-specific data, describing the type of status change.

Remarks Fired when a Control needs to alert the application of a device status change.

Examples are a change in the cash drawer position (open vs. closed) or a change in a POS printer sensor (form present vs. absent).

When a device is enabled, then the Control may fire initial **StatusUpdateEvents** to inform the application of the device state. This behavior, however, is not required.

Release 1.3 and later – Power State Reporting

All device classes may fire **StatusUpdateEvents** with at least the following *Status* parameter values, if **PowerNotify** = OPOS_PN_ENABLED:

Value	Meaning
OPOS_SUE_POWER_ONLINE	The device is powered on and ready for use. Can be returned if CapPowerReporting = OPOS_PR_STANDARD or OPOS_PR_ADVANCED.
OPOS_SUE_POWER_OFF	The device is off or detached from the terminal. Can only be returned if CapPowerReporting = OPOS_PR_ADVANCED.
OPOS_SUE_POWER_OFFLINE	The device is powered on but is either not ready or not able to respond to requests. Can only be returned if CapPowerReporting = OPOS_PR_ADVANCED.
OPOS_SUE_POWER_OFF_OFFLINE	The device is either off or offline. Can only be returned if CapPowerReporting = OPOS_PR_STANDARD.

The common property **PowerState** is also maintained at the current power state of the device.

See Also “Status, Result Code, and State Model”; “Device Power Reporting Model”; **CapPowerReporting** Property, **PowerNotify** Property

CHAPTER 2

Bump Bar

Summary

Properties

<i>Common</i>	<i>Ver</i>	<i>Type</i>	<i>Access</i>	<i>May Use After</i>

StatusUpdateEvent	1.3	Open, Claim, & Enable

General Information

The Bump Bar Control's OLE Programmatic ID is "OPOS.BumpBar".

This device was added in OPOS Release 1.3.

Capabilities

The Bump Bar Control has the following minimal set of capabilities:

- Broadcast methods that can communicate with one, a range, or all bump bar units online.
- Supports bump bar input (keys 0-255).

The Bump Bar Control may also have the following additional capabilities:

- Supports bump bar enunciator output with frequency and duration.
- Supports tactile feedback via an automatic tone when a bump bar key is pressed.

Model

The general model of a bump bar is:

- The bump bar device class is a subsystem of bump bar units. The initial targeted environment is food service, to control the display of order preparation and fulfillment information. Bump bars typically are used in conjunction with remote order displays.

The subsystem can support up to 32 bump bar units.

One Application on one PC or POS Terminal will typically manage and control the entire subsystem of bump bars. If Applications on the same or other PCs and POS Terminals will need to access the subsystem, then this Application must act as a subsystem server and expose interfaces to other Applications.

- All specific methods are broadcast methods. This means that the method can apply to one unit, a selection of units or all online units. The *Units* parameter is a **LONG**, with each bit identifying an individual bump bar unit. (One or more of the constants BB_UID_1 through BB_UID_32 are bitwise ORed to form the bitmask.) The service object will attempt to satisfy the method for all unit(s) indicated in the *Units* parameter. If an error is received from one or more units, the **ErrorUnits** property is updated with the appropriate units in error. The **ErrorString** property is updated with a description of the error or errors received. The method will then return with the corresponding OPOS error. In the case where two or more units encounter different errors, the service object should determine the most severe OPOS error to return.
- The common methods **CheckHealth**, **ClearInput**, and **ClearOutput** are not broadcast methods and use the unit ID indicated in the **CurrentUnitID** property. (One of the constants BB_UID_1 through BB_UID_32 are selected.) See the description of these common methods to understand how the current unit ID property is used.
- When the current unit ID property is set by the application, all the corresponding properties are updated to reflect the settings for that unit.

If the **CurrentUnitID** property is set to a unit ID that is not online, the dependent properties will contain non-initialized values.

The **CurrentUnitID** uniquely represents a single bump bar unit. The definitions range from BB_UID_1 to BB_UID_32. These definitions are also used to create the bitwise parameter, *Units*, used in the broadcast methods. See the Examples section below for usage.

Input – Bump Bar

The Bump Bar Control follows the general “Input Model” for event-driven input with some differences:

- When input is received by the Control, it enqueues a **DataEvent**.
- This device does not support the **AutoDisable** property, so the control will not automatically disable itself when a **DataEvent** is enqueued.
- An enqueued **DataEvent** can be delivered to the application when the **DataEventEnabled** property is TRUE and other event delivery requirements are met. Just before delivering this event, the Control copies the data into properties, and disables further data events by setting the **DataEventEnabled** property to FALSE. This causes subsequent input data to be enqueued by the Control while the application processes the current input and associated properties. When the application has finished the current input and is ready for more data, it reenables events by setting **DataEventEnabled** to TRUE.
- An **ErrorEvent** or events are enqueued if the Control encounters an error while gathering or processing input, and are delivered to the application when the **DataEventEnabled** property is TRUE and other event delivery requirements are met.
- The **BumpBarDataCount** property may be read to obtain the number of bump bar **DataEvents** for a specific unit ID enqueued by the Control. The **DataCount** property can be read to obtain the total number of data events enqueued by the Control.
- Input enqueued by the Control may be deleted by calling the **ClearInput** method. See **ClearInput** method description for more details.

The Bump Bar Control must supply a mechanism for translating its internal key scan codes into user-defined codes which are returned by the data event. Note that this translation *must* be end-user configurable. The default translated key value is the scan code value.

Output – Tone

The bump bar follows the general “Output Model”, with some enhancements:

- The **BumpBarSound** method is performed either synchronously or asynchronously, depending on the value of the **AsyncMode** property. When **AsyncMode** is FALSE, then this method operates synchronously and returns its completion status to the application.
- When **AsyncMode** is TRUE, then this method operates as follows:
 - ◆ The Control buffers the request, sets the **OutputID** property to an identifier for this request, and returns as soon as possible. When the device completes the request successfully, then the Control updates the **EventUnits** property and fires an **OutputCompleteEvent**. A parameter of this event contains the output ID of the completed request.
 Asynchronous methods will not return an error status due to a bump bar problem, such as communications failure. These errors will only be reported by an **ErrorEvent**. An error status is returned only if the bump bar is not claimed and enabled, a parameter is invalid, or the request cannot be enqueued. The first two error cases are due to an application error, while the last is a serious system resource exception.
 - ◆ If an error occurs while performing an asynchronous request, an **ErrorEvent** is fired. The **EventUnits** property is set to the unit or units in error. The **EventString** property is also set.
*Note: **ErrorEvent** updates **EventUnits** and **EventString**. If an error is reported by a broadcast method, then **ErrorUnits** and **ErrorString** are set instead.*
 The event handler may call synchronous bump bar methods (but not asynchronous methods), then can either retry the outstanding output or clear it.
 - ◆ The Control guarantees that asynchronous output is performed on a first-in first-out basis.
 - ◆ All output buffered by the Control may be deleted by setting the **CurrentUnitID** property and calling the **ClearOutput** method. **OutputCompleteEvents** will not be fired for cleared output. This method also stops any output that may be in progress (when possible).

Example

Sounds one tone on unit ID 1 and unit ID 4. The frequency is set to 64 Hertz and will sound for 100 milliseconds.

```
BB.BumpBarSound( BB_UID_1 | BB_UID_4, 64, 100, 1, 0 )
```

Device Sharing

The bump bar is an exclusive-use device. Its device sharing rules are:

- The application must claim the device before enabling it.
- The application must claim and enable the device before accessing many bump bar specific properties.
- The application must claim and enable the device before calling methods that manipulate the device.
- When a **ClaimDevice** method is called again, settable device characteristics are restored to their condition at **ReleaseDevice**.
- See the “Summary” table for precise usage prerequisites.

Properties

AsyncMode Property R/W

Syntax	BOOL AsyncMode;				
Remarks	<p>If TRUE, then the BumpBarSound method will be performed asynchronously. If FALSE, tones are generated synchronously.</p> <p>This property is initialized to FALSE by the Open method.</p>				
Return	<p>When this property is set, the following value is placed in the ResultCode property:</p> <table><tr><th>Value</th><th>Meaning</th></tr><tr><td>OPOS_SUCCESS</td><td>The property was set successfully.</td></tr></table>	Value	Meaning	OPOS_SUCCESS	The property was set successfully.
Value	Meaning				
OPOS_SUCCESS	The property was set successfully.				
See Also	BumpBarSound Method; “Output Model”				

AutoToneDuration Property R/W

Syntax	LONG AutoToneDuration;						
Remarks	<p>Sets the duration (in milliseconds) of the automatic tone for the bump bar unit specified by the CurrentUnitID property.</p> <p>This property is initialized to the default value for each online bump bar unit when the device is first enabled following the Open method.</p>						
Return	<p>When this property is set, one of the following values is placed in the ResultCode property:</p> <table><tr><th>Value</th><th>Meaning</th></tr><tr><td>OPOS_SUCCESS</td><td>The property was set successfully.</td></tr><tr><td>OPOS_E_ILLEGAL</td><td>An illegal value was specified. The ErrorString property is updated before return.</td></tr></table>	Value	Meaning	OPOS_SUCCESS	The property was set successfully.	OPOS_E_ILLEGAL	An illegal value was specified. The ErrorString property is updated before return.
Value	Meaning						
OPOS_SUCCESS	The property was set successfully.						
OPOS_E_ILLEGAL	An illegal value was specified. The ErrorString property is updated before return.						
See Also	CurrentUnitID Property						

AutoToneFrequency Property R/W

Syntax	LONG AutoToneFrequency;						
Remarks	<p>Sets the frequency (in Hertz) of the automatic tone for the bump bar unit specified by the CurrentUnitID property.</p> <p>This property is initialized to the default value for each online bump bar unit when the device is first enabled following the Open method.</p>						
Return	<p>When this property is set, one of the following values is placed in the ResultCode property:</p> <table><tr><th>Value</th><th>Meaning</th></tr><tr><td>OPOS_SUCCESS</td><td>The property was set successfully.</td></tr><tr><td>OPOS_E_ILLEGAL</td><td>An illegal value was specified. The ErrorString property is updated before return.</td></tr></table>	Value	Meaning	OPOS_SUCCESS	The property was set successfully.	OPOS_E_ILLEGAL	An illegal value was specified. The ErrorString property is updated before return.
Value	Meaning						
OPOS_SUCCESS	The property was set successfully.						
OPOS_E_ILLEGAL	An illegal value was specified. The ErrorString property is updated before return.						
See Also	CurrentUnitID Property						

BumpBarDataCount Property

Syntax	LONG BumpBarDataCount;
Remarks	<p>Indicates the number of DataEvents enqueued for the bump bar unit specified by the CurrentUnitID property.</p> <p>The application may interrogate BumpBarDataCount to determine whether additional input is enqueued from a bump bar unit, but has not yet been delivered because of other application processing, freezing of events, or other causes.</p> <p>This property is initialized to zero by the Open method.</p>
See Also	CurrentUnitID Property; DataEvent Event

CapTone Property

Syntax	BOOL CapTone;
Remarks	<p>If TRUE, the bump bar unit specified by the CurrentUnitID property supports an enunciator; otherwise it is FALSE</p> <p>This property is initialized when the device is first enabled following the Open method.</p>
See Also	CurrentUnitID Property

CurrentUnitID Property R/W

Syntax	LONG CurrentUnitID;
Remarks	<p>Selects the current bump bar unit ID. Some properties and methods apply only to the selected bump bar unit ID as noted. Up to 32 units are allowed for one bump bar device. The unit ID definitions range from BB_UID_1 to BB_UID_32.</p> <p>The following properties and methods apply only to the selected bump bar ID:</p> <ul style="list-style-type: none">• Properties: AutoToneDuration, AutoToneFrequency, BumpBarDataCount, CapTone, Keys. <p>Setting CurrentUnitID will update these properties to the current values for the specified unit.</p> <ul style="list-style-type: none">• Methods: CheckHealth, ClearInput, ClearOutput. <p>This property is initialized to BB_UID_1 when the device is first enabled following the Open method.</p>
Return	<p>When this property is set, one of the following values is placed in the ResultCode property:</p>

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An illegal unit ID was specified. The ErrorString property is updated before return.

DataCount Property (Common)

Syntax	LONG DataCount;
Remarks	<p>Indicates the total number of DataEvents enqueued at the control. All units online are included in this value. The number of enqueued events for a specific unit ID is stored in the BumpBarDataCount property.</p> <p>The application may interrogate DataCount to determine whether additional input is enqueued from a device, but has not yet been delivered because of other application processing, freezing of events, or other causes.</p> <p>This property is initialized to zero by the Open method.</p>
See Also	BumpBarDataCount Property; DataEvent Event; “Input Model”

ErrorString Property

Syntax	BSTR ErrorString;
Remarks	<p>When an error occurs for any method that acts on a bitwise set of bump bar units, the ErrorString will contain a description of the error which occurred to the unit(s) specified by the ErrorUnits property.</p> <p>If an error occurs during processing of an asynchronous request, the ErrorEvent updates the property EventString instead.</p> <p>This property is initialized to an empty string by the Open method.</p>
See Also	ErrorUnits Property

ErrorUnits Property

- Syntax** **LONG ErrorUnits;**
- Remarks** When an error occurs for any method that acts on a bitwise set of bump bar units, the **ErrorUnits** will contain a bitwise mask of the unit(s) that encountered an error.
- If an error occurs during processing of an asynchronous request, the **ErrorEvent** updates the property **EventUnits** instead.
- This property is initialized to zero by the **Open** method.
- See Also** **ErrorString** Property

EventString Property

- Syntax** **BSTR EventString;**
- Remarks** When an **ErrorEvent** is delivered, this property is set to a description of the error which occurred to the unit(s) specified by the **EventUnits** property.
- This property is initialized to an empty string by the **Open** method.
- See Also** **EventUnits** Property; **ErrorEvent**

EventUnitID Property

- Syntax** **LONG EventUnitID;**
- Remarks** Just before the Control delivers a **DataEvent** to the Application, it sets this property to the bump bar unit ID causing the event. The unit ID definitions range from BB_UID_1 to BB_UID_32.
- See Also** **DataEvent**

EventUnits Property

Syntax	LONG EventUnits;
Remarks	<p>When an OutputCompleteEvent, output ErrorEvent, or StatusUpdateEvent is delivered, the EventUnits property will contain a bitwise mask of the unit(s).</p> <p>This property is initialized to zero by the Open method.</p>
See Also	OutputCompleteEvent, ErrorEvent, StatusUpdateEvent

Keys Property

Syntax	LONG Keys;
Remarks	<p>Indicates the number of keys on the bump bar unit specified by the CurrentUnitID property.</p> <p>This property is initialized when the device is first enabled following the Open method.</p>
See Also	CurrentUnitID Property

Timeout Property R/W

Syntax **LONG Timeout;**

Remarks Timeout value in milliseconds used by the bump bar device to complete all output methods supported. If the device cannot successfully complete an output method within the timeout value, then the method returns a failure status if **AsyncMode** is FALSE, or enqueues an **ErrorEvent** if **AsyncMode** is TRUE.

This property is initialized to a Service Object dependent timeout following the **Open** method.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An negative timeout value was specified. The ErrorString property is updated before return.

See Also **AsyncMode** Property; **ErrorString** Property ; **BumpBarSound** Method

UnitsOnline Property

Syntax **LONG UnitsOnline;**

Remarks Bitwise mask indicating the bump bar units online, where zero or more of the unit constants BB_UID_1 (bit 0 on) through BB_UID_32 (bit 31 on) are bitwise ORed. 32 units are supported.

This property is initialized when the device is first enabled following the **Open** method. This property is updated as changes are detected, such as before a **StatusUpdateEvent** is fired and during the **CheckHealth** method.

See Also **CheckHealth** Method; **StatusUpdateEvent** Event; “Model” Discussion Section

Methods

BumpBarSound Method

Syntax **LONG BumpBarSound (LONG Units, LONG Frequency, LONG Duration, LONG NumberOfCycles, LONG InterSoundWait);**

Parameter	Description
<i>Units</i>	Bitwise mask indicating which bump bar unit(s) to operate on.
<i>Frequency</i>	Tone frequency in Hertz.
<i>Duration</i>	Tone duration in milliseconds.
<i>NumberOfCycles</i>	If OPOS_FOREVER, then start bump bar sounding and, repeat continuously. Else perform the specified number of cycles.
<i>InterSoundWait</i>	When <i>NumberOfCycles</i> is not one, then pause for <i>InterSoundWait</i> milliseconds before repeating the tone cycle (before playing the tone again)

Remarks Sound the bump bar enunciator for the bump bar(s) specified by the *Units* parameter.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

The duration of a tone cycle is:

Duration parameter +
InterSoundWait parameter (except on the last tone cycle)

After the bump bar has started an asynchronous sound, then the sound may be stopped by using the **ClearOutput** method. (When an *InterSoundWait* value of OPOS_FOREVER was used to start the sound, then the application must use **ClearOutput** to stop the continuous sounding of tones.)

If the **CapTone** property is FALSE for the selected unit(s), an OPOS_E_ILLEGAL is returned.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> • <i>NumberOfCycles</i> is neither a positive, non-zero value nor OPOS_FOREVER. • <i>NumberOfCycles</i> is OPOS_FOREVER when AsyncMode is FALSE. • A negative <i>InterSoundWait</i> was specified. • <i>Units</i> is zero or a non-existent unit was specified. • A unit in <i>Units</i> does not support the CapTone capability. The ErrorUnits and ErrorString properties may be updated before return.
OPOS_E_FAILURE	An error occurred while communicating with one of the bump bar units specified by the <i>Units</i> parameter. The ErrorUnits and ErrorString properties are updated before return. (Can only be returned if AsyncMode is FALSE.)
<i>Other Values</i>	See ResultCode .

See Also **AsyncMode** Property; **ErrorString** Property; **ErrorUnits** Property; **CapTone** Property; **ClearOutput** Method

CheckHealth Method (Common)

Syntax **LONG CheckHealth (LONG Level);**

The *Level* parameter indicates the type of health check to be performed on the device. The following values may be specified:

Value	Meaning
OPOS_CH_INTERNAL	Perform a health check that does not physically change the device. The device is tested by internal tests to the extent possible.
OPOS_CH_EXTERNAL	Perform a more thorough test that may change the device.
OPOS_CH_INTERACTIVE	Perform an interactive test of the device. The Service Object will typically display a modal dialog box to present test options and results.

Remarks When OPOS_CH_INTERNAL or OPOS_CH_EXTERNAL level is requested, the method will check the health of the bump bar unit specified by the **CurrentUnitID** property. When the current unit ID property is set to a unit that is not currently online, the device will attempt to check the health of the bump bar unit and report a communication error if necessary. The OPOS_CH_INTERACTIVE health check operation is up to the service object designer.

A text description of the results of this method is placed in the **CheckHealthText** property.

The **UnitsOnline** property will be updated with any changes before returning to the application.

The **CheckHealth** method is always synchronous.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	Indicates that the health check procedure was initiated properly, and when possible to determine, indicates that the device is healthy. However, the health of many devices can only be determined by a visual inspection of the test results.
OPOS_E_ILLEGAL	The specified health check level is not supported by the Service Object.
OPOS_E_FAILURE	An error occurred while communicating with the bump bar unit specified by the CurrentUnitID property.
<i>Other Values</i>	See ResultCode .

See Also **CurrentUnitID** Property; **UnitsOnline** Property

ClearInput Method (Common)

Syntax **LONG ClearInput ();**

Remarks Called to clear the device input that has been buffered for the unit specified by the **CurrentUnitID** property.

Any data events that are enqueued – usually waiting for **DataEventEnabled** to be set to TRUE and **FreezeEvents** to be set to FALSE – are also cleared.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_CLAIMED	The device is claimed by another process.
OPOS_E_NOTCLAIMED	The device must be claimed before this method can be used.

See Also **CurrentUnitID** Property; “Input Model”

ClearOutput Method (Common)

Syntax **LONG ClearOutput ();**

Remarks Called to clear the tone outputs that have been buffered for the unit specified by the **CurrentUnitID** property.

Any output complete and output error events that are enqueued – usually waiting for **DataEventEnabled** to be set to TRUE and **FreezeEvents** to be set to FALSE – are also cleared.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_CLAIMED	The device is claimed by another process.
OPOS_E_NOTCLAIMED	The device must be claimed before this method can be used.

See Also **CurrentUnitID** Property; “Output Model”

SetKeyTranslation Method

Syntax **LONG SetKeyTranslation (LONG *Units*, LONG *ScanCode*, LONG *LogicalKey*);**

Parameter	Description
<i>Units</i>	Bitwise mask indicating which bump bar unit(s) to set key translation for.
<i>ScanCode</i>	The bump bar generated key scan code. Valid values 0-255.
<i>LogicalKey</i>	The translated logical key value. Valid values 0-255.

Remarks This method will assign a logical key value to a device-specific key scan code for the bump bar unit(s) specified by the *Units* parameter. The logical key value is used during translation during the **DataEvent**.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none">• <i>ScanCode</i> or <i>LogicalKey</i> are out of range.• <i>Units</i> is zero or a non-existent unit was specified. The ErrorUnits and ErrorString properties are updated before return.
<i>Other Values</i>	See ResultCode .

See Also **ErrorUnits** Properties; **ErrorString** Properties; **DataEvent** Event

Events

DataEvent Event

Syntax **void DataEvent (LONG *Status*);**

The *Status* parameter is divided into four bytes. Depending on the Event Type, located in the low word, the remaining 2 bytes will contain additional data. The diagram below indicates how the parameter *Status* is divided:

High Word		Low Word (Event Type)
High Byte	Low Byte	
Unused. Always zero.	LogicalKeyCode	BB_DE_KEY

Remarks Fired to present input data from a bump bar unit to the Application. The low word contains the Event Type. The high word contains additional data depending on the Event Type. When the Event Type is BB_DE_KEY, the low byte of the high word contains the LogicalKeyCode for the key pressed on the bump bar unit. The LogicalKeyCode value is device independent; it has been translated by the Service Object from its original hardware specific value. Valid ranges are 0-255.

The **EventUnitID** property is updated before delivering the event.

See Also “Input Model”; **EventUnitID** Property; **DataEventEnabled** Property; **FreezeEvents** Property

OutputCompleteEvent Event

Syntax **void OutputCompleteEvent (LONG *OutputID*);**

The *OutputID* parameter indicates the ID number of the asynchronous output request that is complete. The **EventUnits** property is updated before delivering.

Remarks Fired when a previously started asynchronous output request completes successfully.

See Also **EventUnits** Property; “Output Model”

StatusUpdateEvent Event

Syntax **void StatusUpdateEvent (LONG *Status*);**

The *Status* parameter reports a change in the power state of a bump bar unit.

Remarks Fired when the bump bar device detects a power state change.

Deviation from the standard **StatusUpdateEvent** (see page 74):

- Before delivering the event, the **EventUnits** property is set to the units for which the new power state applies.
- When the bump bar device is enabled, then the Control will fire a **StatusUpdateEvent** to specify the bitmask of online units.
- While the bump bar device is enabled, a **StatusUpdateEvent** is fired when the power state of one or more units change. If more than one unit changes state at the same time, the Service Object may choose to either fire multiple events or to coalesce the information into a minimal number of events applying to **EventUnits**.

See Also **EventUnits** Property

ErrorEvent Event

Syntax **void ErrorEvent (LONG *ResultCode*, LONG *ResultCodeExtended*, LONG *ErrorLocus*, LONG* *pErrorResponse*);**

Parameter	Description
<i>ResultCode</i>	Result code causing the error event. See ResultCode for values.
<i>ResultCodeExtended</i>	Extended result code causing the error event. See ResultCodeExtended for values.
<i>ErrorLocus</i>	Location of the error. See values below.
<i>pErrorResponse</i>	Pointer to the error event response. See values below.

The *ErrorLocus* parameter may be one of the following:

Value	Meaning
OPOS_EL_OUTPUT	Error occurred while processing asynchronous output.
OPOS_EL_INPUT	Error occurred while gathering or processing event-driven input. No input data is available.
OPOS_EL_INPUT_DATA	Error occurred while gathering or processing event-driven input, and some previously buffered data is available.

The contents at the location pointed to by the *pErrorResponse* parameter are preset to a default value, based on the *ErrorLocus*. The application may change the value to one of the following:

Value	Meaning
OPOS_ER_RETRY	Use only when locus is OPOS_EL_OUTPUT. Retry the asynchronous output. The error state is exited. Default when locus is OPOS_EL_OUTPUT.
OPOS_ER_CLEAR	Clear the buffered input data. The error state is exited. Default when locus is OPOS_EL_INPUT.
OPOS_ER_CONTINUEINPUT	Use only when locus is OPOS_EL_INPUT_DATA. Acknowledges the error and directs the Control to continue processing. The Control remains in the error state, and will deliver additional DataEvents as directed by the DataEventEnabled property. When all input has been delivered and the DataEventEnabled property is again set to TRUE, then another ErrorEvent is delivered with locus OPOS_EL_INPUT. Default when locus is OPOS_EL_INPUT_DATA.

- Remarks** Fired when an error is detected while trying to read bump bar data.
- Input error events are not delivered until the **DataEventEnabled** property is TRUE, so that proper application sequencing occurs.
- The **EventUnits** and **EventString** properties are updated before return.
- See Also** “Status, Result Code, and State Model”; **DataEventEnabled** Property; **EventUnits** Property; **EventString** Property

CHAPTER 3

Cash Changer

Summary

Properties

<i>Common</i>	<i>Ver</i>	<i>Type</i>	<i>Access</i>	<i>May Use After</i>

General Information

The Cash Changer Control's OLE programmatic ID is "OPOS.CashChanger".

This device was added in OPOS Release 1.2.

Capabilities

The Cash Changer has the following capabilities:

- Reports the cash units and corresponding unit counts available in the Cash Changer.
- Dispenses of a specified amount of cash from the device in either bills, coins, or both into a user-specified exit.
- Dispenses of a specified number of cash units from the device in either bills, coins, or both into a user-specified exit.
- Reports of jam conditions within the device.
- Support for more than one currency.

The Cash Changer may also have the following additional capabilities:

- Reporting the fullness levels of the Cash Changer's cash units. Conditions which may be indicated include empty, near empty, full, and near full states.
- Reporting of a possible (or probable) cash count discrepancy in the data reported by the **ReadCashCounts** method.
- ***OPOS Release 1.5 and later – Support for the receipt of money is added.***
- The cash (bills and coins) which is put into the device between the start and end of cash acceptance is reported to the application. The contents of the report are cash units and cash counts.

Model

The general model of a Cash Changer is:

- Supports several cash types such as coins, bills, and combinations of coins and bills. The supported cash type for a particular currency is noted by the list of cash units in the **CurrencyCashList** property.
- Consists of any combination of features to aid in the cash processing functions such as a cash entry holding bin, a number of slots or bins which can hold the cash, and cash exits.
- Provides programmatic control *for the dispensing of cash*. The accepting of cash by the device (for example, to replenish cash) will be optionally controlled by the APIs provided in this model. The application can call the **ReadCashCounts** method to retrieve the current unit count for each cash unit.
- The current model of the Cash Changer device class provides programmatic control *for the dispensing of cash*.
- After Release 1.5 : Cash acceptance treatment is provided as an option.
(For example, the accounts of the deposit and storage, or it is in such cases as the supplement of the cash)
- May have multiple exits. The number of exits is specified in the **DeviceExits** property. The application chooses a dispensing exit by setting the **CurrentExit** property. The cash units which may be dispensed to the current exit are indicated by the **ExitCashList** property. When the **CurrentExit** value is 1, the exit is considered the “primary exit” which is typically used during normal processing for dispensing cash to a customer following a retail transaction. When **CurrentExit** is a value greater than 1, the exit is considered an “auxiliary exit”. An “auxiliary exit” typically is used for special purposes such as dispensing quantities or types of cash not targeted for the “primary exit”.
- Dispenses cash into the exit specified by the **CurrentExit** property is performed by calling either the **DispenseChange** or **DispenseCash** method. With the **DispenseChange** method, the application specifies a total amount to be dispensed, and it is the responsibility of the Cash Changer device or the Control to dispense the proper amount of cash from the various slots or bins. With the **DispenseCash** method, the application specifies a count of each cash unit to be dispensed.
- Dispenses cash either synchronously or asynchronously, depending on the value of the **AsyncMode** property.

When **AsyncMode** is FALSE, then the cash dispensing methods are performed synchronously and the dispense method returns the completion status to the application.

When **AsyncMode** is TRUE and OPOS_SUCCESS is returned by either **DispenseChange** or **DispenseCash**, then the method is performed asynchronously and its completion is indicated by a **StatusUpdateEvent** event containing CHAN_STATUS_ASYNC as its *Status* value. The method's completion status is set in the **AsyncResultCode** and **AsyncResultCodeExtended** properties.

The values of the **AsyncResultCode** and **AsyncResultCodeExtended** properties are same as those returned in the **ResultCode** and **ResultCodeExtended** properties when synchronous dispensing is chosen.

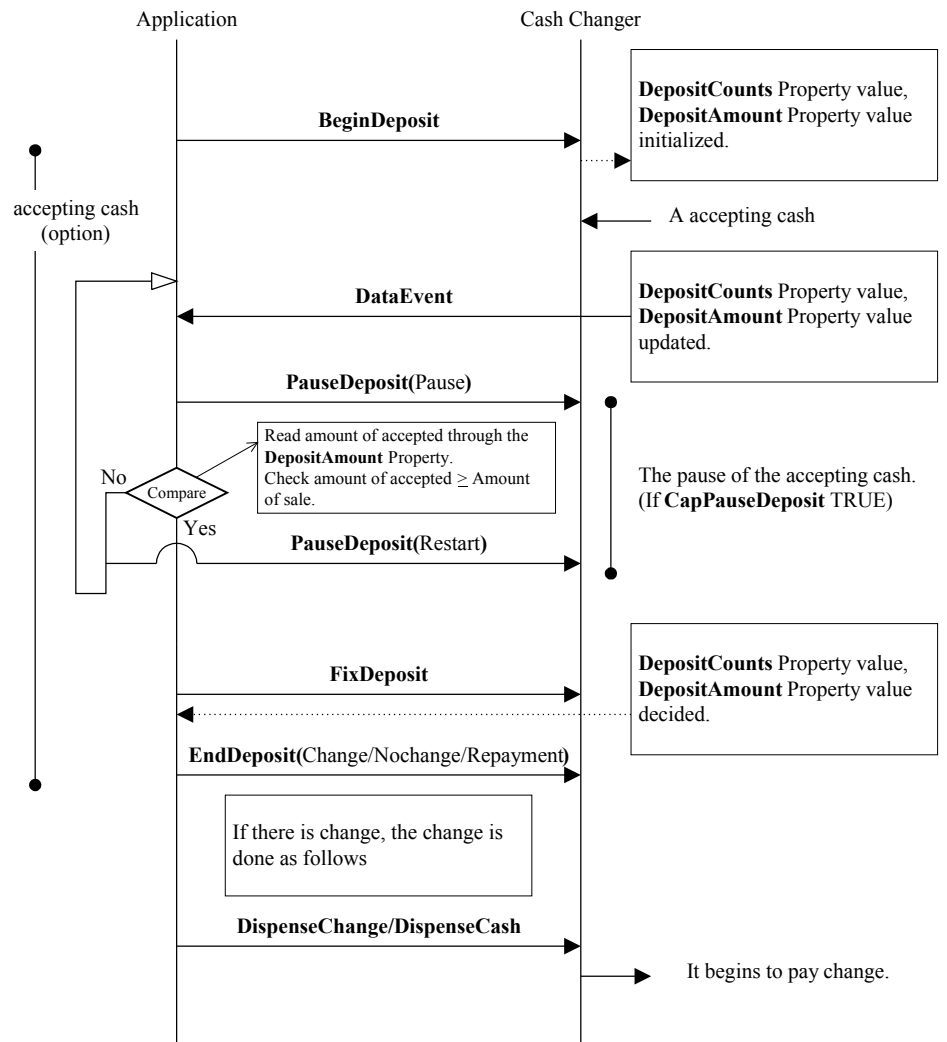

Nesting of asynchronous Cash Changer operations is illegal; only one asynchronous method can be processed at a time.

ReadCashCounts may not be performed while an asynchronous method is being performed since doing so could likely report incorrect cash counts.

- May support more than one currency. The **CurrencyCode** property may be set to the currency, selecting from a currency in the list **CurrencyCodeList**. The properties and methods **CurrencyCashList**, **ExitCashList**, **DispenseCash**, **DispenseChange**, and **ReadCashCounts** all act upon the current currency only.
- Sets the cash slot (or cash bin) conditions are set in the **DeviceStatus** property to show empty and near empty status, and in the **FullStatus** property to show full and near full status. If there are one or more empty cash slots, then **DeviceStatus** property is CHAN_STATUS_EMPTY, and if there are one or more full cash slots, then **FullStatus** property is CHAN_STATUS_FULL.
- ***OPOS Release 1.5 and later – Support for cash acceptance is added as an option.***
- The cash acceptance model is as follows:
- The **DispenseChange** and **DispenseCash** methods are independent of the cash acceptance function. The **AsyncMode** property value has no effect on cash acceptance methods.
- If the **CapDeposit** property is TRUE, cash acceptance is supported and the **BeginDeposit**, **FixDeposit** and **EndDeposit** methods will be in use. Cash dispensing is disabled while cash acceptance is in progress. Also, cash acceptance is disabled while cash dispensing is in progress.
- When the application calls the **BeginDeposit** method, the **DepositCounts** and **DepositAmount** properties are initialized to zero.
- When cash changer accepts cash, the value of the **DepositCounts** and **DepositAmount** properties increase, and a **DataEvent** is fired if the **CapDepositDataEvent** property is TRUE.

- If the **CapPauseDeposit** property is TRUE, the application can pause cash acceptance by calling the **PauseDeposit** method with a parameter of **CHAN_DEPOSIT_PAUSE**. Then, the value of the **DepositCounts** and **DepositAmount** properties is fixed. If the application want to resume cash acceptance, it calls the **PauseDeposit** method again with a parameter value of **CHAN_DEPOSIT_RESTART**. By reading either the **DepositCounts** or **DepositAmount** property, the application can get exact amount of accepted cash, and compare the accepted cash total with the sale amount. If the amount of accepted cash is equal to or greater than the amount of the sale, the application will call the **FixDeposit** method. If the amount of accepted cash is less than amount of the sale, the application will call the **PauseDeposit** method with **CHAN_DEPOSIT_RESTART**. In order to get the total amount of accepted cash, the application should repeat the **PauseDeposit** method.
- When the **FixDeposit** method is called, the cash changer stops accepting cash and the value of the **DepositCounts** and **DepositAmount** is fixed.
- If necessary, the application must calculate the change by means of the **DepositCounts** and **DepositAmount** properties after the **FixDeposit** method. After the **FixDeposit** method is called, the application cannot resume cash acceptance and must call the **EndDeposit** method in order to complete the cash acceptance process.
- In order to terminate the cash acceptance process, the application must call the **EndDeposit** method.
- The values of the *Success* parameter of the **EndDeposit** method have the following meanings:
 - ♦ **CHAN_DEPOSIT_CHANGE**: The application dispenses cash. This typically is used to dispense change due from a sale.
 - ♦ **CHAN_DEPOSIT_NOCHANGE**: The application dose not dispense cash. This typically indicates that the total amount of accepted cash is equal to the total amount of the sale.
 - ♦ **CHAN_DEPOSIT_REPAY**: The application will repay the entire amount of cash. This typically is a cancellation of the sale. **CHAN_DEPOSIT_REPAY** can only be used when **CapRepayDeposit** is TRUE. If **CapRepayDeposit** is FALSE, the application must dispense the total amount of accepted cash by calling either the **DispenseChange** or **DispenseCash** method. Some cash changer may not repay accepted cash depending on cash changer mechanism.
- When the **ClearInput** method is executed, all queued **DataEvents** associated with cash acceptance are cleared, but the value of the **DepositCounts** and **DepositAmount** properties are not cleared.

- In the cash acceptance process, **ErrorEvents** and the **AutoDisable** property are not used.
- The processing of cash acceptance is shown in the following diagram:

Device Sharing

The Cash Changer is an exclusive-use device. Its device sharing rules are:

- The application must claim the device before enabling it.
- The application must claim and enable the device before accessing some of the properties, dispensing or collecting, or receiving status update events.
- See the “Summary” table for precise usage prerequisites.

Properties

AsyncMode Property R/W

Syntax	BOOL AsyncMode;				
Remarks	<p>If TRUE, then the DispenseCash and DispenseChange methods will be performed asynchronously.</p> <p>If FALSE, these methods will be performed synchronously.</p> <p>This property is initialized to FALSE by the Open method.</p>				
Return	<p>When this property is set, the following value is placed in the ResultCode property:</p> <table><tr><th>Value</th><th>Meaning</th></tr><tr><td>OPOS_SUCCESS</td><td>The property was set successfully.</td></tr></table>	Value	Meaning	OPOS_SUCCESS	The property was set successfully.
Value	Meaning				
OPOS_SUCCESS	The property was set successfully.				
See Also	DispenseCash Method; DispenseChange Method; AsyncResultCode Property; AsyncResultCodeExtended Property				

AsyncResultCode Property

Syntax	LONG AsyncResultCode;
Remarks	<p>Holds the completion status of the last asynchronous dispense request (i.e., when DispenseCash or DispenseChange was called with AsyncMode TRUE). This property is set by the control before a StatusUpdateEvent event is delivered with a <i>Status</i> value of CHAN_STATUS_ASYNC.</p> <p>The value of this property is same as the value that would have been in the ResultCode property had the method been performed synchronously.</p>
See Also	DispenseCash Method; DispenseChange Method; AsyncMode Property

AsyncResultCodeExtended Property

Syntax	LONG AsyncResultCodeExtended;
Remarks	Holds the completion status of the last asynchronous dispense request (i.e., when DispenseCash or DispenseChange was called with AsyncMode TRUE). This property is set by the control before a StatusUpdateEvent event is delivered with a <i>Status</i> value of CHAN_STATUS_ASYNC. The value of this property is same as the value that would have been in the ResultCodeExtended property had the method been performed synchronously.
See Also	DispenseCash Method; DispenseChange Method; AsyncMode Property

CapDeposit Property

Added in Release 1.5

Syntax	BOOL CapDeposit;
Remarks	If TRUE, Cash Changer supports cash acceptance; otherwise it is FALSE. This property is initialized by the Open method.
See Also	BeginDeposit Method; EndDeposit Method; FixDeposit Method; PauseDeposit Method

CapDepositDataEvent Property**Added in Release 1.5**

- Syntax** **BOOL CapDepositDataEvent;**
- Remarks** If TRUE, the Cash Changer can report of cash accepted events; otherwise it is FALSE.
- This property is initialized by the **Open** method.
- See Also** **BeginDeposit** Method; **EndDeposit** Method; **FixDeposit** Method; **PauseDeposit** Method

CapDiscrepancy Property

- Syntax** **BOOL CapDiscrepancy;**
- Remarks** If TRUE, the **ReadCashCounts** method can report effective *pDiscrepancy* values; otherwise it is FALSE.
- This property is initialized by the **Open** method.
- See Also** **ReadCashCounts** method

CapEmptySensor Property

- Syntax** **BOOL CapEmptySensor;**
- Remarks** If TRUE, the Cash Changer can report the condition that some cash slots are empty; otherwise it is FALSE.
- This property is initialized by the **Open** method.
- See Also** **DeviceStatus** Property; **StatusUpdateEvent**

CapFullSensor Property

Syntax	BOOL CapFullSensor;
Remarks	If TRUE, the Cash Changer can report the condition that some cash slots are full; otherwise it is FALSE. This property is initialized by the Open method.
See Also	FullStatus Property; StatusUpdateEvent

CapNearEmptySensor Property

Syntax	BOOL CapNearEmptySensor;
Remarks	If TRUE, the Cash Changer can report the condition that some cash slots are nearly empty; otherwise it is FALSE. This property is initialized by the Open method.
See Also	DeviceStatus Property; StatusUpdateEvent

CapNearFullSensor Property

Syntax	BOOL CapNearFullSensor;
Remarks	If TRUE, the Cash Changer can report the condition that some cash slots are nearly full, otherwise it is FALSE. This property is initialized by the Open method.
See Also	FullStatus Property; StatusUpdateEvent

CapPauseDeposit Property**Added in Release 1.5**

- Syntax** **BOOL CapPauseDeposit;**
- Remarks** If TRUE, the Cash Changer has the capability to suspend cash acceptance temporarily; otherwise it is FALSE.
- This property is initialized by the **Open** method.
- See Also** **PauseDeposit** Method

CapRepayDeposit Property**Added in Release 1.5**

- Syntax** **BOOL CapRepayDeposit;**
- Remarks** If TRUE, the Cash Changer has the capability to return cash that was deposited; otherwise it is FALSE.
- This property is initialized by the **Open** method.
- See Also** **EndDeposit** Method

CurrencyCashList Property

Syntax **BSTR CurrencyCashList;**

Remarks Holds the cash units supported in the Cash Changer for the currency represented by the **CurrencyCode** property.

The string consists of ASCII numeric comma delimited values which denote the units of coins, then the ASCII semicolon character (“;”) followed by ASCII numeric comma delimited units of bills that can be used with the Cash Changer. If a semicolon (“;”) is absent, then all units represent coins.

Below are sample **CurrencyCashList** values in Japan.

- “1,5,10,50,100,500” —
1, 5, 10, 50, 100, 500 yen coin.
- “1,5,10,50,100,500;1000,5000,10000” —
1, 5, 10, 50, 100, 500 yen coin and 1000, 5000, 10000 yen bill.
- “;1000,5000,10000” —
1000, 5000, 10000 yen bill.

This property is initialized by the **Open** method, and is updated when **CurrencyCode** is set.

See Also **CurrencyCode** Property

CurrencyCode Property R/W

Syntax **WSTR CurrencyCode;**

Remarks Contains the active currency code to be used by Cash Changer operations.

This property is initialized to an appropriate value by the **Open** method. This value is guaranteed to be one of the set of currencies specified by the **CurrencyCodeList** property.

Return When this property is set, one of the following values is placed in the **ResultCode** property.

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	A value was specified that is not within CurrencyCodeList .

See Also **CurrencyCodeList** Property

CurrencyCodeList Property

Syntax **WSTR CurrencyCodeList;**

Remarks Holds a list of ASCII three-character ISO 4217 currency codes separated by commas.

This property is initialized by the **Open** method..

For example, if the string is "JPY,USD", then the Cash Changer supports both Japanese and U.S. monetary units.

See Also **CurrencyCode** Property

CurrentExit Property R/W**Syntax** **LONG CurrentExit;****Remarks** Holds the current cash dispensing exit. The value 1 represents the primary exit (or *normal* exit), while values greater than 1 are considered auxiliary exits. Legal values range from 1 to **DeviceExits**.

This property is initialized to 1 by the **Open** method.

Examples below are samples of typical property value sets in Japan.

CurrencyCode is “JPY” and **CurrencyCodeList** is “JPY”.

- Cash Changer supports coins; only one exit supported :
CurrencyCashList = “1,5,10,50,100,500”
DeviceExits = 1
CurrentExit = 1 : **ExitCashList** = “1,5,10,50,100,500”
- Cash Changer supports both coins and bills; an auxiliary exit is used for larger quantities of bills :
CurrencyCashList = “1,5,10,50,100,500;1000,5000,10000”
DeviceExits = 2
When **CurrentExit** = 1 : **ExitCashList** = “1,5,10,50,100,500;1000,5000”
When **CurrentExit** = 2 : **ExitCashList** = “;1000,5000,10000”
- Cash Changer supports bills; an auxiliary exit is used for larger quantities of bills :
CurrencyCashList = “;1000,5000,10000”
DeviceExits = 2
When **CurrentExit** = 1 : **ExitCashList** = “;1000,5000”
When **CurrentExit** = 2 : **ExitCashList** = “;1000,5000,10000”

Return When this property is set, one of the following values is placed in the **ResultCode** property.

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An invalid CurrentExit value was specified.

See Also **CurrencyCashList** Property; **DeviceExits** Property; **ExitCashList** Property

DepositAmount Property**Added in Release 1.5****Syntax** **LONG DepositAmount;****Remarks** The total amount of cash accepted.

For example, if the currency is Japanese yen and **DepositAmount** is set to 18057, after calling the **BeginDeposit** method, there would be 18,057 yen in the Cash Changer.

This property is initialized by the **Open** method.

See Also **CurrencyCode** Property

DepositCashList Property**Added in Release 1.5****Syntax** **BSTR DepositCashList;****Remarks** Holds the cash units supported in the Cash Changer for the currency represented by the **CurrencyCode** property. It is set to null when cash acceptance is not supported.

The string consists of ASCII numeric comma delimited values which denote the units of coins, then the ASCII semicolon character (“;”) followed by ASCII numeric comma delimited values for the bills that can be used with the Cash Changer. If the semicolon (“;”) is absent, then all units represent coins.

Below are some sample **DepositCashList** values used in Japan.

- “1,5,10,50,100,500” —
1, 5, 10, 50, 100, 500 yen coin.
- “1,5,10,50,100,500;1000,5000,10000” —
1, 5, 10, 50, 100, 500 yen coin and 1000, 5000, 10000 yen bill.
- “;1000,5000,10000” —
1000, 5000, 10000 yen bill.

This property is initialized by the **Open** method, and is updated when **CurrencyCode** is set.

See Also **CurrencyCode** Property**DepositCodeList Property****Added in Release 1.5****Syntax** **BSTR DepositCodeList;****Remarks** Holds the currency code indicators of the cash accepted. It is set to null when cash acceptance is not supported.

The string consists of a list of ASCII three-character ISO 4217 currency codes separated by commas. For example, if the string is “JPY,USD”, then the Cash Changer supports both Japanese and U.S. monetary units.

This property is initialized by the **Open** method.

See Also **CurrencyCode** Property

DepositCounts Property**Added in Release 1.5****Syntax** **BSTR DepositCounts;**

Remarks Holds the total of the cash accepted by the cash units. The format of this property is the same as *CashCounts* in the **DispenseCash** method. Cash units inside this property are the same as the **DepositCashList** property, and are in the same order. It is set to null when cash acceptance is not supported.

For example, if the currency is Japanese yen and string of the **DepositCounts** property is set to:

1:80,5:77,10:0,50:54,100:0,500:87

After the call of the **BeginDeposit** method, there would be 80 one yen coins, 77 five yen coins and 54 fifty yen coins, and 87 five hundred yen coins in the Cash Changer.

This property is initialized by the **Open** method.

See Also **CurrencyCode** Property

DepositStatus Property**Added in Release 1.5****Syntax** **LONG DepositStatus;****Remarks** Holds the current status of the cash acceptance operation. It may be one of the following values:

Value	Meaning
CHAN_STATUS_DEPOSIT_START	Start accepting cash.
CHAN_STATUS_DEPOSIT_END	Finished accepting cash.
CHAN_STATUS_DEPOSIT_NONE	Does not support cash acceptance.
CHAN_STATUS_DEPOSIT_COUNT	Counting or repaying the cash accepted.
CHAN_STATUS_DEPOSIT_JAM	A mechanical fault has occurred.

This property is initialized and kept current while the device is enabled. This property is set to CHAN_STATUS_DEPOSIT_END after initialization, or to CHAN_STATUS_DEPOSIT_NONE if the device does not support cash acceptance.

DeviceExits Property**Syntax** **LONG DeviceExits;****Remarks** The number of exits for dispensing cash.

This property is initialized by the **Open** method.**See Also** **CurrentExit** Property

DeviceStatus Property

Syntax **LONG DeviceStatus;**

Remarks Holds the current status of the Cash Changer. It may be one of the following:

Value	Meaning
CHAN_STATUS_OK	The current condition of the Cash Changer is satisfactory.
CHAN_STATUS_EMPTY	Some cash slots are empty.
CHAN_STATUS_NEAREMPTY	Some cash slots are nearly empty.
CHAN_STATUS_JAM	A mechanical fault has occurred.

This property is initialized and kept current while the device is enabled. If more than one condition is present, then the order of precedence starting at the highest is fault, empty, and near empty.

ExitCashList Property

Syntax **BSTR ExitCashList;**

Remarks Holds the cash units which may be dispensed to the exit which is denoted by **CurrentExit** property. The supported cash units are either the same as **CurrencyCashList**, or a subset of it. The string format is identical to that of **CurrencyCashList**.

This property is initialized by the **Open** method, and is updated when **CurrencyCode** or **CurrentExit** is set.

See Also **CurrencyCode** Property; **CurrencyCashList** Property; **CurrentExit** Property

FullStatus Property

Syntax **LONG FullStatus;**

Remarks Holds the current full status of the cash slots. It may be one of the following:

Value	Meaning
CHAN_STATUS_OK	All cash slots are neither nearly full nor full.
CHAN_STATUS_FULL	Some cash slots are full.
CHAN_STATUS_NEARFULL	Some cash slots are nearly full.

This property is initialized and kept current while the device is enabled.

Methods

BeginDeposit Method

Added in Release 1.5

Syntax **LONG BeginDeposit ();**

Remarks Cash acceptance is started.

The following property values are initialized by the call of this method:

- The value of each cash unit of the **DepositCounts** property is set to zero.
- The **DepositAmount** property is set to zero.

After calling this method, if **CapDepositDataEvent** is TRUE, cash acceptance is reported by **DataEvents** until **FixDeposit** is called while the deposit operation is not paused.

Return One of the following values is returned by this method and placed in the **ResultCode** property.

Value	Meaning
OPOS_SUCCESS	This method was successful.
OPOS_E_ILLEGAL	Either the Cash Changer does not support cash acceptance, or the call sequence is not correct.
<i>Other Values</i>	See ResultCode .

See Also **DepositCounts** Property; **DepositAmount** Property; **CapDepositDataEvent** Property; **EndDeposit** Method; **FixDeposit** Method; **PauseDeposit** Method

DispenseCash Method

Syntax **LONG DispenseCash (BSTR *CashCounts*);**

The *CashCounts* parameter contains the dispensing cash units and counts, represented by the format of “cash unit:cash counts, ..;.., cash unit:cash counts”. Units before “;” represent coins, and units after “;” represent bills. If “;” is absent, then all units represent coins.

Remarks Dispenses the cash from the Cash Changer into the exit specified by **CurrentExit**. The cash dispensed is specified by pairs of cash units and counts.

This Method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Some *CashCounts* examples, using Japanese yen as the currency, are shown below.

- “10:5,50:1,100:3,500:1”
Dispense 5 ten yen coins, 1 fifty yen coins, 3 one hundred yen coins, 1 five hundred yen coins.
- “10:5,100:3;1000:10”
Dispense 5 ten yen coins, 3 one hundred yen coins, and 10 one thousand yen bills.
- “;1000:10,10000:5”
Dispense 10 one thousand yen bills and 5 ten thousand yen bills.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The specified cash was dispensed successfully, or DispenseCash method was performed asynchronously.
OPOS_E_BUSY	The specified cash cannot be dispensed because an asynchronous method is in progress.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> • The <i>CashCounts</i> parameter value was illegal for the current exit. • Cash could not be dispensed because cash acceptance was in progress
OPOS_E_EXTENDED	ResultCodeExtended = OPOS_ECHAN_OVERDISPENSE : The specified cash cannot be dispensed because of a cash shortage.
<i>Other Values</i>	See ResultCode .

See Also **AsyncMode** Property; **CurrentExit** Property

DispenseChange Method

Syntax	LONG DispenseChange (LONG Amount); The <i>Amount</i> parameter contains the amount of change to be dispensed. It is up to the Cash Changer to determine what combination of bills and coins will satisfy the tender requirements from its available supply of cash.
Remarks	Dispenses the specified amount of cash from the Cash Changer into the exit represented by CurrentExit . This Method is performed synchronously if AsyncMode is FALSE, and asynchronously if AsyncMode is TRUE.
Return	One of the following values is returned by the method and placed in the ResultCode property:

Value	Meaning
OPOS_SUCCESS	The specified change was dispensed successfully, or DispenseChange method was performed asynchronously.
OPOS_E_BUSY	The specified change cannot be dispensed because an asynchronous method is in progress.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> • A negative or zero <i>Amount</i> was specified. • The <i>Amount</i> could not be dispensed based on the values specified in ExitCashList for the current exit. • Change could not be dispense cash acceptance was in progress.
OPOS_E_EXTENDED	ResultCodeExtended = OPOS_ECHAN_OVERDISPENSE : The specified change cannot be dispensed because of a cash shortage.

Other Values See **ResultCode**.

See Also **AsyncMode** Property; **CurrentExit** Property

EndDeposit Method**Added in Release 1.5****Syntax** **LONG EndDeposit (LONG *Success*);**

Holds the value of how to deal with the cash that was deposited is established by the *Success* parameter. It will have one of the following values:

Parameter	Description
CHAN_DEPOSIT_CHANGE	The deposited amount is greater than the amount required.
CHAN_DEPOSIT_NOCHANGE	The deposited amount is equal to or less than the amount required.
CHAN_DEPOSIT_REPAY	The deposit is to be repaid through the cash deposit exit or the cash payment exit.

Remarks Cash acceptance is completed.

Before calling this method, the application must calculate the difference between the amount of the deposit and the amount required. If the deposited amount was greater than the amount required, use CHAN_DEPOSIT_CHANGE as the *Success* parameter. If the deposited amount was equal to or less than the amount required, use CHAN_DEPOSIT_NOCHANGE as the *Success* parameter.

If *Success* is CHAN_DEPOSIT_REPAY, the deposit is repaid through either the cash deposit exit or the cash payment exit without storing the actual deposited cash.

The application must call **FixDeposit** before calling this method.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	This method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> Cash acceptance is not supported. The call sequence is not correct. BeginDeposit and FixDeposit must be called in sequence before calling this method.
<i>Other Values</i>	See ResultCode .

See Also **DepositCounts** Property; **DepositAmount** Property; **CapDepositDataEvent** Property; **BeginDeposit** Method; **FixDeposit** Method; **PauseDeposit** Method

FixDeposit Method

Added in Release 1.5

Syntax **LONG FixDeposit ();**

Remarks When this method is called all property values are updated to reflect the current values in the Cash Changer.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	This method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> • Cash acceptance is not supported. • The call sequence is not correct. BeginDeposit must be called before calling this method.
<i>Other Values</i>	See ResultCode .

See Also **DepositCounts** Property; **DepositAmount** Property; **BeginDeposit** Method; **EndDeposit** Method; **PauseDeposit** Method

PauseDeposit Method

Added in Release 1.5

Syntax **LONG PauseDeposit (LONG Control);**

This method is used to suspend or resume the process of depositing cash. The *Control* parameter will be one of the following values:

Parameter	Description
CHAN_DEPOSIT_PAUSE	Cash acceptance will be paused.
CHAN_DEPOSIT_RESTART	Cash acceptance will be resumed.

Remarks The process of depositing cash is either suspended or resumed.

If *Control* is CHAN_DEPOSIT_PAUSE, the cash acceptance operation is paused. The deposit process will remain paused until this method is called with *Control* equal to CHAN_DEPOSIT_RESTART. The **FixDeposit** method may be called while cash acceptance is paused.

When the deposit process is paused, the **DepositCounts** and **DepositAmount** properties are updated to reflect the current state of the Cash Changer. The property values will not be changed again until the deposit is resumed.

If *Control* is CHAN_DEPOSIT_RESTART, the deposit process is resumed.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	This method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> Cash acceptance is not supported. The call sequence is not correct. BeginDeposit must be called before calling this method. The deposit process is already paused and <i>Control</i> is CHAN_DEPOSIT_PAUSE or the deposit process is not paused and <i>Control</i> is CHAN_DEPOSIT_RESTART.
<i>Other Values</i>	See ResultCode .

See Also **DepositCounts** Property; **DepositAmount** Property; **CapDepositDataEvent** Property; **CapPauseDeposit** Property; **BeginDeposit** Method; **EndDeposit** Method; **FixDeposit** Method

ReadCashCounts Method

Syntax **LONG ReadCashCounts (BSTR* *pCashCounts*, BOOL* *pDiscrepancy*);**

Parameter	Description
<i>pCashCounts</i>	The cash count data is placed into the string pointed to by <i>pCashCounts</i> .
<i>pDiscrepancy</i>	If the integer pointed to by <i>pDiscrepancy</i> is set to TRUE by this method, then there is some cash which was not able to be included in the counts reported in <i>pCashCounts</i> ; otherwise it is FALSE.

Remarks The format of the string pointed to by *pCashCounts* is the same as *CashCounts* in the **DispenseCash** method. Each unit in *pCashCounts* matches a unit in the **CurrencyCashList** property, and is in the same order.

For example if the currency is Japanese yen and string returned at the *pCashCounts* parameter is set to

1:80,5:77,10:0,50:54,100:0,500:87

as a result of calling the **ReadCashCounts** method, then there would be 80 one yen coins, 77 five yen coins, 54 fifty yen coins, and 87 five hundred yen coins in the Cash Changer.

If **CapDiscrepancy** property is FALSE, then *pDiscrepancy* is always FALSE.

Usually, the cash total calculated by *pCashCounts* parameter is equal to the cash total in a Cash Changer. But, there are some cases where a discrepancy may occur because of existing uncountable cash in a Cash Changer. An example would be when a cash slot is “overflowing” such that the device has lost its ability to accurately detect and monitor the cash.

Return One of the following values is returned by this method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	This method was successful.
OPOS_E_BUSY	Cash units and counts cannot be read because an asynchronous method is outstanding.
<i>Other Values</i>	See ResultCode .

See Also **DispenseCash** Method; **CapDiscrepancy** Property; **CurrencyCashList** Property

Events

DataEvent

Added in Release 1.5

Syntax	void DataEvent (LONG <i>Status</i>); The <i>Status</i> parameter contains zero.
Remarks	This event is fired to notify the application when cash counts change while cash acceptance is in progress.

StatusUpdateEvent

Syntax	void StatusUpdateEvent (LONG <i>Status</i>); The <i>Status</i> parameter contains the Cash Changer status condition:																				
	<table> <tr> <th>Value</th><th>Meaning</th></tr> <tr> <td>CHAN_STATUS_EMPTY</td><td>Some cash slots are empty.</td></tr> <tr> <td>CHAN_STATUS_NEAREMPTY</td><td>Some cash slots are nearly empty.</td></tr> <tr> <td>CHAN_STATUS_EMPTYOK</td><td>No cash slots are either empty or nearly empty.</td></tr> <tr> <td>CHAN_STATUS_FULL</td><td>Some cash slots are full.</td></tr> <tr> <td>CHAN_STATUS_NEARFULL</td><td>Some cash slots are nearly full.</td></tr> <tr> <td>CHAN_STATUS_FULLOK</td><td>No cash slots are either full or nearly full.</td></tr> <tr> <td>CHAN_STATUS_JAM</td><td>A mechanical fault has occurred.</td></tr> <tr> <td>CHAN_STATUS_JAMOK</td><td>A mechanical fault has recovered.</td></tr> <tr> <td>CHAN_STATUS_ASYNC</td><td>Asynchronously performed method has completed.</td></tr> </table>	Value	Meaning	CHAN_STATUS_EMPTY	Some cash slots are empty.	CHAN_STATUS_NEAREMPTY	Some cash slots are nearly empty.	CHAN_STATUS_EMPTYOK	No cash slots are either empty or nearly empty.	CHAN_STATUS_FULL	Some cash slots are full.	CHAN_STATUS_NEARFULL	Some cash slots are nearly full.	CHAN_STATUS_FULLOK	No cash slots are either full or nearly full.	CHAN_STATUS_JAM	A mechanical fault has occurred.	CHAN_STATUS_JAMOK	A mechanical fault has recovered.	CHAN_STATUS_ASYNC	Asynchronously performed method has completed.
Value	Meaning																				
CHAN_STATUS_EMPTY	Some cash slots are empty.																				
CHAN_STATUS_NEAREMPTY	Some cash slots are nearly empty.																				
CHAN_STATUS_EMPTYOK	No cash slots are either empty or nearly empty.																				
CHAN_STATUS_FULL	Some cash slots are full.																				
CHAN_STATUS_NEARFULL	Some cash slots are nearly full.																				
CHAN_STATUS_FULLOK	No cash slots are either full or nearly full.																				
CHAN_STATUS_JAM	A mechanical fault has occurred.																				
CHAN_STATUS_JAMOK	A mechanical fault has recovered.																				
CHAN_STATUS_ASYNC	Asynchronously performed method has completed.																				
Remarks	<p>Fired when the Cash Changer detects a status change.</p> <p>For changes in the fullness levels, the Cash Changer is only able to fire StatusUpdateEvents when the device has a sensor capable of detecting the full, near full, empty, and/or near empty states and the corresponding capability properties for these states are set.</p> <p>Jam conditions may be reported whenever this condition occurs; likewise for asynchronous method completion.</p>																				

The completion statuses of asynchronously performed methods are placed in the **AsyncResultCode** and **AsyncResultCodeExtended** properties.

CHAPTER 4

Cash Drawer

Summary

Properties

<i>Common</i>	<i>Ver</i>	<i>Type</i>	<i>Access</i>	<i>May Use After</i>

OutputCompleteEvent	1.0	<i>Not Supported</i>
StatusUpdateEvent	1.0	Open & Enable

General Information

The Cash Drawer Control's OLE programmatic ID is "OPOS.CashDrawer".

Capabilities

The Cash Drawer Control has the following capability:

- Supports a command to "open" the cash drawer.

The cash drawer may have the following additional capability:

- **Drawer status reporting:** Can determine whether a particular drawer is open or closed in environments where the drawer is the only drawer accessible via a hardware port.
- **Drawer unique status reporting:** Can determine whether a particular drawer is open or closed in environments where more than one drawer is accessible via the same hardware port.

Device Sharing

The cash drawer is a sharable device. Its device sharing rules are:

- After opening and enabling the device, the application may access all properties and methods and will receive status update events.
- If more than one application has opened and enabled the device, all applications may access its properties and methods. Status update events are fired to all of the applications.
- If one application claims the cash drawer, then only that application may call the **OpenDrawer** and **WaitForDrawerClose** methods. This feature provides a degree of security, such that these methods may effectively be restricted to the main POS application if that application claims the device at startup.
- See the "Summary" table for precise usage prerequisites.

Properties

CapStatus Property

Syntax	BOOL CapStatus;
Remarks	If TRUE, the drawer can report status. If FALSE, the drawer is not able to determine whether cash drawer is open or closed.

*This property is initialized by the **Open** method.*

CapStatusMultiDrawerDetect Property Added in Release 1.5

Syntax	BOOL CapStatusMultiDrawerDetect;
Remarks	If TRUE, statuses unique to each drawer in multi-drawer configurations* can be reported.

If FALSE, the following implications exist:

DrawerOpened value of FALSE indicates that the drawer is closed.

DrawerOpened value of TRUE indicates that at least one drawer is open, and it *might* be the particular drawer in question. This case can occur in multi-drawer configurations* where only one status is reported indicating either a.) all drawers are closed, or b.) one or more drawers are open.

This property is only meaningful if **CapStatus** is TRUE.

This property is initialized by the **Open** method.

*Multi-Drawer Configuration – A hardware configuration where a printer or terminal supports opening more than one drawer independently via the same channel or hardware port. A typical example is a configuration with a “Y” cable connected to a single hardware port that controls two drawers.

DrawerOpened Property

Syntax **BOOL DrawerOpened;**

Remarks If TRUE, the drawer is open*.
 If FALSE, the drawer is closed.

If the capability **CapStatus** is FALSE, then the device does not support status reporting, and **DrawerOpened** is always FALSE.

*If the capability **CapStatusMultiDrawerDetect** is FALSE, then a **DrawerOpened** value of TRUE indicates at least one drawer is open, and it *might* be the particular drawer in question for multi-drawer configurations. See **CapStatusMultiDrawerDetect** for clarification.

This property is initialized and kept current while the device is enabled.

Methods

OpenDrawer Method

Syntax	LONG OpenDrawer ()
Remarks	Call to open the drawer.
Return	One of the following values is returned by the method and placed in the ResultCode property:
Value	Meaning
OPOS_SUCCESS	The drawer was opened successfully.
<i>Other Values</i>	See ResultCode .

WaitForDrawerClose Method

Syntax **LONG WaitForDrawerClose (LONG *BeepTimeout*, LONG *BeepFrequency*, LONG *BeepDuration*, LONG *BeepDelay*);**

Parameter	Description
<i>BeepTimeout</i>	Number of milliseconds to wait before starting an alert beeper.
<i>BeepFrequency</i>	Audio frequency of the alert beeper in hertz.
<i>BeepDuration</i>	Number of milliseconds that the beep tone will be sounded.
<i>BeepDelay</i>	Number of milliseconds between the sounding of beeper tones.

Remarks Call to wait until the cash drawer is closed. If the drawer is still open after *BeepTimeout* milliseconds, then the system alert beeper is started.

Unless an error occurs, this method will not return to the application while the drawer is open. When the cashier closes the drawer, the beeper is turned off.

If the capability **CapStatusMultiDrawerDetect** is FALSE then unless an error occurs, this method will not return to the application while *any* drawers are open in a multi-drawer configuration. When all drawers are detected as closed, the beeper is turned off. If the capability **CapStatus** is FALSE, then the device does not support status reporting, and this method will return immediately with a successful status.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The drawer was properly closed.
<i>Other Values</i>	See ResultCode .

Events

StatusUpdateEvent Event

Syntax **void StatusUpdateEvent (LONG Status);**

The *Status* parameter contains the updated drawer status.

Release 1.0 - 1.2

If *Status* contains a non-zero value, then the drawer is open.

If *Status* contains a zero value, then the drawer is closed.

Release 1.3 and later

One of the following values may be returned:

Value	Meaning
CASH_SUE_DRAWERCLOSED (= 0)	The drawer is closed.
CASH_SUE_DRAWEROPEN (= 1)	The drawer is open.
<i>Power reporting StatusUpdateEvent values</i>	
	See StatusUpdateEvent description on page 74. (Can only be returned if the application sets PowerNotify to OPOS_PN_ENABLED.)

Remarks Fired when the open status of the drawer changes.

If the capability **CapStatus** is FALSE, then the device does not support status reporting, and this event will never be fired.

If the capability **CapStatusMultiDrawerDetect** is FALSE, then a CASH_SUE_DRAWEROPEN value (= 1) indicates at least one drawer is open, and it *might* be the particular drawer in question for multi-drawer configurations. See **CapStatusMultiDrawerDetect** for clarification

CHAPTER 5

CAT - Credit Authorization Terminal

Summary

Properties

<i>Common</i>	<i>Ver</i>	<i>Type</i>	<i>Access</i>	<i>May Use After</i>
AutoDisable	1.4	Boolean	R/W	<i>Not Supported</i>
BinaryConversion	1.4	Long	R/W	Open
CapPowerReporting	1.4	Long	R	Open

ErrorEvent	1.4	Open, Claim, & Enable
OutputCompleteEvent	1.4	Open, Claim, & Enable
StatusUpdateEvent	1.4	Open, Claim, & Enable

General Information

The CAT Control's OLE programmatic ID is "OPOS.CAT".

This device was added in OPOS Release 1.4.

Description of terms

- Authorization method

Methods defined by this device class that have the *Authorize* prefix in their name. These methods require communication with an approval agency.
- Authorization operation

The period from the invocation of an authorization method until the authorization is completed. This period differs depending upon whether operating in synchronous or asynchronous mode.
- Credit Authorization Terminal (CAT) Device

A CAT device typically consists of a display, keyboard, magnetic stripe card reader, receipt printing device, and a communications device. CAT devices are predominantly used in Japan where they are required by law. Essentially a CAT device can be considered a device that shields the encryption, message formatting, and communication functions of an electronic funds transfer (EFT) operation from an application.
- Purchase

The transaction that allows credit card or debit card payments at the POS. It is independent of payment methods (for example, lump-sum payment, payment in installments, revolving payment, etc.).
- Cancel Purchase

The transaction to request voiding a purchase *on the date of purchase*.
- Refund Purchase

The transaction to request voiding a purchase *after the date of purchase*. This differs from cancel purchase in that a cancel purchase operation can often be handled by updating the daily log at the CAT device, while the refund purchase operation typically requires interaction with the approval agency.
- Authorization Completion

The state of a purchase when the response from the approval agency is "suspended". The purchase is later completed after a voice approval is received from the card company.

- **Pre-Authorization**
The transaction to reserve an estimated amount in advance of the actual purchase with customer's credit card presentation and card entry at CAT.
- **Cancel Pre-Authorization**
The transaction to request canceling pre-authorization.
- **Card Check**
The transaction to perform a negative card file validation of the card presented by the customer. Typically negative card files contain card numbers that are known to fail approval. Therefore the Card Check operation removes then need for communication to the approval agency in some instances.
- **Daily log**
The daily log of card transactions that have been approved by the card companies.

- **Payment condition**
Condition of payment such as lump-sum payment, payment by bonus, payment in installments, revolving payment, and the combination of those payments. Debit payment is also available. See the **PaymentCondition**, **PaymentMedia** and **PaymentDetail** properties for details.
- **Approval agency**
The agency to decide whether or not to approve the purchase based on the card information, the amount of purchase, and payment type. The approval agency is generally the card company.

Capabilities

The CAT control is capable of the following general mode of operation:

- This standard defines the application interface with the CAT control and does not depend on the CAT device hardware implementation. Therefore, the hardware implementation of a CAT device may be as follows:
 - ◆ **Separate type (POS interlock)**
The dedicated CAT device is externally connected to the POS (for instance, via an RS-232 connection).
 - ◆ **Built-in type**
The hardware structure is the same as the separate type but is installed within the POS housing.
- The CAT device receives each authorization request containing a purchase amount and tax from CAT control.
- The CAT device generally requests the user to swipe a magnetic card when it receives an authorization request from CAT control.
- Once a magnetic card is swiped at the CAT device, the device sends the purchase amount and tax to the approval agency using the communications device.
- The CAT device returns the result from the approval agency to the CAT control. The returned data will be stored in the authorization properties by the CAT control for access by applications.

Model

The general models for the CAT control are shown below:

- The CAT control basically follows the output device model. However, multiple methods cannot be issued for asynchronous output; only 1 outstanding asynchronous request is allowed.
- The CAT control issues requests to the CAT device for different types of authorization by invoking the following methods.

Function	Method name	Corresponding Cap property
Purchase	AuthorizeSales	None
Cancel Purchase	AuthorizeVoid	CapAuthorizeVoid
Refund Purchase	AuthorizeRefund	CapAuthorizeRefund
Authorization Completion	AuthorizeCompletion	CapAuthorizeCompletion
Pre-Authorization	AuthorizePreSales	CapAuthorizePreSales
Cancel Pre-Authorization	AuthorizeVoidPreSales	CapAuthorizeVoidPreSales

- The CAT control issues requests to the CAT device for special processing local to the CAT device by invoking the following methods.

Function	Method name	Corresponding Cap property
Card Check	CheckCard	CapCheckCard
Daily log	AccessDailyLog	CapDailyLog

- The CAT control stores the authorization results in the following properties when an authorization operation successfully completes:

Description	Property Name	Corresponding Cap Property
Account number	AccountNumber	None
Additional information	AdditionalSecurityInformation	CapAdditionalSecurityInformation
Approval code	ApprovalCode	None
Card company ID	CardCompanyID	None
Code from the approval agency	CenterResultCode	CapCenterResultCode
Payment condition	PaymentCondition	None
Payment detail	PaymentDetail	CapPaymentDetail
Sequence number	SequenceNumber	None
Slip number	SlipNumber	None
Center transaction number	TransactionNumber	CapTransactionNumber
Transaction type	TransactionType	None

- The **AccessDailyLog** method sets the following property:

Description	Property Name	Corresponding Cap Property
Daily log	DailyLog	CapDailyLog

- Sequence numbers are used to validate that the properties set at completion of a method are indeed associated with the completed method. An incoming *SequenceNumber* argument for each method is compared with the resulting **SequenceNumber** property after the operation associated with the method has completed. If the numbers do not match, or if an application fails to identify the number, there is no guarantee that the values of the properties listed in the two tables correspond to the completed method.

- The **AsyncMode** property determines if methods are run synchronously or asynchronously.
 - ◆ When **AsyncMode** is FALSE, methods will be executed synchronously and their corresponding properties will contain data when the method returns.
 - ◆ When **AsyncMode** is TRUE, methods will return immediately to the application. When the operation associated with the method completes, each corresponding property will be updated by the CAT control prior to an **OutputCompleteEvent**. When **AsyncMode** is TRUE, methods cannot be issued immediately after issuing a prior method; only one outstanding asynchronous method is allowed at a time. However, **ClearOutput** is an exception because its purpose is to cancel an outstanding asynchronous method.
- The methods supported and their corresponding properties vary depending on the CAT control implementation. Applications should verify that particular **Cap** properties are supported before utilizing the capability dependent methods and properties.
- Results of synchronous calls to methods and writable properties will be stored in **ResultCode**. Results of asynchronous processing will be indicated by an **OutputCompleteEvent** or returned in the *ResultCode* argument of an **ErrorEvent**. If **ResultCode** or the *ResultCode* argument is OPOS_E_EXTENDED, detailed device specific information may be stored to **ResultCodeExtended** in synchronous mode and stored to **ErrorEvent** argument *ResultCodeExtended* in asynchronous mode. The result code from the approval agency will be stored in **CenterResultCode** in either mode.
- Training mode occurs continually when **TrainingMode** is TRUE. To discontinue training mode, set **TrainingMode** to FALSE.
- An outstanding asynchronous method can be canceled via the **ClearOutput** method.
- The Daily log can be collected by the **AccessDailyLog** method. Collection will be run either synchronously or asynchronously according to the value of **AsyncMode**.

- Following is the general usage sequence of the CAT control.

Synchronous Mode:

- **Open**
- **ClaimDevice**
- **DeviceEnabled=TRUE**
- Definition of the argument *SequenceNumber*
- Set **PaymentMedia** *Added in Release 1.5*
- **AuthorizeSales()**
- Check **ResultCode**
- Verify that the **SequenceNumber** property matches the value of the **AuthorizeSales()** *SequenceNumber* argument
- Access the properties set by **AuthorizeSales()**
- **DeviceEnabled=FALSE**
- **ReleaseDevice**
- **Close**

Asynchronous Mode:

- **Open**
- **ClaimDevice**
- **DeviceEnabled=TRUE**
- **AsyncMode=TRUE**
- Definition of the argument *SequenceNumber*
- Set **PaymentMedia** *Added in Release 1.5*
- **AuthorizeSales()**
- Check **ResultCode**
- Wait for **OutputCompleteEvent**
- Check the argument *ResultCode*
- Verify that the **SequenceNumber** property matches the value of the **AuthorizeSales()** *SequenceNumber* argument
- Access the properties set by **AuthorizeSales()**
- **DeviceEnabled=FALSE**
- **ReleaseDevice**
- **Close**

Device sharing

The CAT is an exclusive-use device, as follows:

- After opening the device, properties are readable.
- The application must claim the device before enabling it.
- The application must claim and enable the device before calling methods that manipulate the device.
- See the “Summary” table for precise usage prerequisites.

Properties

AccountNumber Property

Syntax	BSTR AccountNumber;
Remarks	This property is initialized to NULL by the Open method and is updated when an authorization operation successfully completes.

AdditionalSecurityInformation Property R/W

Syntax	BSTR AdditionalSecurityInformation;
Remarks	An application can send data to the CAT device by setting this property before issuing an authorization method. Also, data obtained from the CAT device and not stored in any other property as the result of an authorization operation (for example, the account code for a loyalty program) can be provided to an application by storing it in this property. Since the data stored here is device specific, this should not be used for any development that requires portability. The format of this data depends on BinaryConversion property. See BinaryConversion property for more details.
See Also	CapAdditionalSecurityInformation Property; BinaryConversion Property

ApprovalCode Property

Syntax	BSTR ApprovalCode;
Remarks	This property is initialized to NULL by the Open method and is updated when an authorization operation successfully completes.

AsyncMode Property R/W

Syntax	BOOL AsyncMode;	
Remarks	If TRUE, the authorization methods will run asynchronously.	
	If FALSE, the authorization methods will run synchronously.	
	This property is initialized to FALSE by the Open method.	
Return	When this property is set, the following value is placed in the ResultCode property.	
	Value	Meaning
	OPOS_SUCCESS	Property has been properly set up.
See Also	Authorization Methods	

CapAdditionalSecurityInformation Property

Syntax	BOOL CapAdditionalSecurityInformation;
Remarks	If TRUE, the AdditionalSecurityInformation property may be utilized; otherwise it is FALSE.
	This property is initialized by Open method.
See Also	AdditionalSecurityInformation Property

CapAuthorizeCompletion Property

Syntax	BOOL CapAuthorizeCompletion;
Remarks	If TRUE, the AuthorizeCompletion method has been implemented; otherwise it is FALSE.
	This property is initialized by the Open method.
See Also	AuthorizeCompletion Method

CapAuthorizePreSales Property

- Syntax** **BOOL CapAuthorizePreSales;**
- Remarks** If TRUE, the **AuthorizePreSales** method has been implemented; otherwise it is FALSE.
- This property is initialized by the **Open** method.
- See Also** **AuthorizePreSales** Method

CapAuthorizeRefund Property

- Syntax** **BOOL CapAuthorizeRefund;**
- Remarks** If TRUE, the **AuthorizeRefund** method has been implemented; otherwise it is FALSE.
- This property is initialized by the **Open** method.
- See Also** **AuthorizeRefund** Method

CapAuthorizeVoid Property

- Syntax** **BOOL CapAuthorizeVoid;**
- Remarks** If TRUE, the **AuthorizeVoid** method has been implemented; otherwise it is FALSE.
- This property is initialized by the **Open** method.
- See Also** **AuthorizeVoid** Method

CapAuthorizeVoidPreSales Property

Syntax	BOOL CapAuthorizeVoidPreSales;
Remarks	If TRUE, the AuthorizeVoidPreSales method has been implemented; otherwise it is FALSE. This property is initialized by the Open method.
See Also	AuthorizeVoidPreSales Method

CapCenterResultCode Property

Syntax	BOOL CapCenterResultCode;
Remarks	If TRUE, the CenterResultCode property has been implemented; otherwise it is FALSE. This property is initialized by the Open method.
See Also	CenterResultCode Property

CapCheckCard Property

Syntax	BOOL CapCheckCard;
Remarks	If TRUE, the CheckCard method has been implemented; otherwise it is FALSE. This property is initialized by the Open method.
See Also	CheckCard Method

CapDailyLog Property

Syntax **LONG CapDailyLog;**

Remarks Shows the daily log ability of the device.

Value	Meaning
CAT_DL_NONE	The CAT device does not have the daily log functions.
CAT_DL_REPORTING	The CAT device only has an intermediate total function which reads the daily log but does not erase the log.
CAT_DL_SETTLEMENT	The CAT device only has the “final total” and “erase daily log” functions.
CAT_DL_REPORTING_SETTLEMENT	The CAT device has both the intermediate total function and the final total and erase daily log function.

This property is initialized by the **Open** method.

See Also **DailyLog** Property; **AccessDailyLog** Method

CapInstallments Property

Syntax **BOOL CapInstallments;**

Remarks If TRUE, the item “Installments” which is stored in the **DailyLog** property as the result of **AccessDailyLog** will be provided; otherwise it is FALSE.

This property is initialized by the **Open** method.

See Also **DailyLog** Property

CapPaymentDetail Property

Syntax	BOOL CapPaymentDetail;
Remarks	<p>If TRUE, the PaymentDetail property has been implemented; otherwise it is FALSE.</p> <p>This property is initialized by Open method.</p>
See Also	PaymentDetail Property

CapTaxOthers Property

Syntax	BOOL CapTaxOthers;
Remarks	<p>If TRUE, the item “TaxOthers” which is stored in the DailyLog property as the result of AccessDailyLog will be provided; otherwise it is FALSE.</p> <p>Note that this property is not related to the “TaxOthers” argument used with the authorization methods.</p> <p>This property is initialized by the Open method.</p>
See Also	DailyLog Property

CapTransactionNumber Property

Syntax	BOOL CapTransactionNumber;
Remarks	<p>If TRUE, the TransactionNumber property has been implemented; otherwise it is FALSE.</p> <p>This property is initialized by the Open method.</p>
See Also	TransactionNumber Property

CapTrainingMode Property

Syntax	BOOL CapTrainingMode;
Remarks	If TRUE, the TrainingMode property has been implemented; otherwise it is FALSE. This property is initialized by the Open method.
See Also	TrainingMode Property

CardCompanyID Property

Syntax	BSTR CardCompanyID;
Remarks	This property is initialized to NULL by the Open method and is updated when an authorization operation successfully completes. The length of the ID string varies depending upon the CAT device.

CenterResultCode Property

Syntax	BSTR CenterResultCode;
Remarks	Contains the code from the approval agency. Check the approval agency for the actual codes to be stored. This property is initialized to NULL by the Open method and is updated when an authorization operation successfully completes

DailyLog Property

Syntax **BSTR DailyLog;**

Remarks Stores the result of the **AccessDailyLog** method. The data is delimited by CR(13 Decimal) + LF(10 Decimal) for each transaction and is stored in ASCII code. The detailed data of each transaction is comma separated [i.e. delimited by“,” (44 Decimal)].

The details of one transaction are shown as follows:

No.	Item	Property	Corresponding Cap Property
1	Card company ID	CardCompanyID	None
2	Transaction type	TransactionType	None
3	Transaction date Note 1)	None	None
4	Transaction number Note 3)	TransactionNumber	CapTransactionNumber
5	Payment condition	PaymentCondition	None
6	Slip number	SlipNumber	None
7	Approval code	ApprovalCode	None
8	Purchase date Note 5)	None	None
9	Account number	AccountNumber	None
10	Amount Note 4)	The argument <i>Amount</i> of the authorization method or the amount actually approved.	None
11	Tax/others Note 3)	The argument <i>TaxOthers</i> of the authorization method.	CapTaxOthers
12	Installments Note 3)	None	CapInstallments
13	Additional data Note 2)	AdditionalSecurityInformation	CapAdditionalSecurityInformation

Notes from the previous table:

1) Format

Item	Format
Transaction date	YYYYMMDDHHMMSS
Purchase date	MMDD

Some CAT devices may not support seconds by the internal clock. In that case, the seconds field of the transaction date is filled with “00”

2) Additional data

The area where the CAT device stores the vendor specific data. This enables an application to receive data other than that defined in this specification. The data stored here is vendor specific and should not be used for development which places an importance on portability.

3) If the corresponding **Cap** property is FALSE

Cap property is set to FALSE if the CAT device provides no corresponding data. In such instances, the item can't be displayed so the next comma delimiter immediately follows. For example, if “Amount” is 1234 yen and “Tax/others” is missing and “Installments” is 2, the description will be “1234,,2”. This makes the description independent of **Cap** property and makes the position of each data item consistent.

4) Amount

Amount always includes “Tax/others” even if item 11 is present.

5) Purchase date

The date manually entered for the purchase transaction after approval.

Example An example of daily log content is shown below.

Item	Description	Meaning
Card company ID	102	JCB
Transaction type	CAT_TRANSACTION_SALES	Purchase
Transaction date	19980116134530	1/16/1998 13:45:30
Transaction number	123456	123456
Payment condition	CAT_PAYMENT_INSTALLMENT_1	Installment 1
Slip number	12345	12345
Approval code	0123456	0123456
Purchase date	None	None
Account number	1234123412341234	1234-1234-1234-1234
Amount	12345	12345JPY
Tax/others	None	None
Number of payments	2	2
Additional data	12345678	Specific information

The actual data stored in **DailyLog** will be as follows.

```
102,10,19980116134530,123456,61,12345,0123456,,1234123412341234,12345,,2,12345678[CR][LF]
```

See Also **CapDailyLog** Property; **AccessDailyLog** Method

PaymentCondition Property

Syntax **LONG PaymentCondition;**

Remarks Holds the payment condition of the most recent successful authorization operation.

This property will be set to one of the following values. See **PaymentDetail** for the detailed payment string that correlates to the following **PaymentCondition** values.

Value	Meaning
CAT_PAYMENT_LUMP	Lump-sum
CAT_PAYMENT_BONUS_1	Bonus 1
CAT_PAYMENT_BONUS_2	Bonus 2
CAT_PAYMENT_BONUS_3	Bonus 3
CAT_PAYMENT_BONUS_4	Bonus 4
CAT_PAYMENT_BONUS_5	Bonus 5
CAT_PAYMENT_INSTALLMENT_1	Installment 1
CAT_PAYMENT_INSTALLMENT_2	Installment 2
CAT_PAYMENT_INSTALLMENT_3	Installment 3
CAT_PAYMENT_BONUS_COMBINATION_1	Bonus combination payments 1
CAT_PAYMENT_BONUS_COMBINATION_2	Bonus combination payments 2
CAT_PAYMENT_BONUS_COMBINATION_3	Bonus combination payments 3
CAT_PAYMENT_BONUS_COMBINATION_4	Bonus combination payments 4
CAT_PAYMENT_REVOLVING	Revolving
CAT_PAYMENT_DEBIT	Debit card

See Also **PaymentDetail** Property

PaymentDetail Property

Syntax **BSTR PaymentDetail;**

Remarks Contains payment condition details as the result of an authorization operation. Payment details vary depending on the value of **PaymentCondition**. The data will be stored as comma separated ASCII code. NULL means that no data is stored and represents a **BSTR** with zero length data.

PaymentCondition	PaymentDetail
CAT_PAYMENT_LUMP	NULL
CAT_PAYMENT_BONUS_1	NULL
CAT_PAYMENT_BONUS_2	Number of bonus payments
CAT_PAYMENT_BONUS_3	1 st bonus month
CAT_PAYMENT_BONUS_4*	Number of bonus payments, 1 st bonus month, 2 nd bonus month, 3 rd bonus month, 4 th bonus month, 5 th bonus month, 6 th bonus month
CAT_PAYMENT_BONUS_5*	Number of bonus payments, 1 st bonus month, 1 st bonus amount, 2 nd bonus month, 2 nd bonus amount, 3 rd bonus month, 3 rd bonus amount, 4 th bonus month, 4 th bonus amount, 5 th bonus month, 5 th bonus amount, 6 th bonus month, 6 th bonus amount
CAT_PAYMENT_INSTALLMENT_1	1 st billing month, Number of payments
CAT_PAYMENT_INSTALLMENT_2*	1 st billing month, Number of payments, 1 st amount, 2 nd amount, 3 rd amount, 4 th amount, 5 th amount, 6 th amount
CAT_PAYMENT_INSTALLMENT_3	1 st billing month, Number of payments, 1 st amount
CAT_PAYMENT_BONUS_COMBINATION_1	1 st billing month, Number of payments
CAT_PAYMENT_BONUS_COMBINATION_2	1 st billing month, Number of payments, bonus amount
CAT_PAYMENT_BONUS_COMBINATION_3*	1 st billing month, Number of payments, number of bonus payments, 1 st bonus month, 2 nd bonus month, 3 rd bonus month, 4 th bonus month, 5 th bonus month, 6 th bonus month
CAT_PAYMENT_BONUS_COMBINATION_4*	1 st billing month, Number of payments, number of bonus payments, 1 st bonus month, 1 st bonus amount, 2 nd bonus month, 2 nd bonus amount, 3 rd bonus month, 3 rd bonus amount, 4 th bonus month, 4 th bonus amount, 5 th bonus month, 5 th bonus amount, 6 th bonus month, 6 th bonus amount
CAT_PAYMENT_REVOLVING	NULL
CAT_PAYMENT_DEBIT	NULL

*Maximum 6 installments

The payment types and names vary depending on the CAT device. The following are the payment types and terms available for CAT devices. Note that there are some differences between OPOS terms and those used by the CAT devices. The goal of this table is to synchronize these terms.

General Payment Category	Entry item	PaymentCondition Value		CAT	CAT	G-CAT	JET-S	SG-CAT	Master-T
				Name	(Old CAT)				
				Credit Card	Not specified	Not specified	JCB	VISA	MASTER
				OPOS Term	Card Company Terms				
Lump-sum	(None)	10	Lump-sum	Lump-sum	Lump-sum	Lump-sum	Lump-sum	Lump-sum	Lump-sum
Bonus	(None)	21	Bonus 1	Bonus 1	Bonus 1	Bonus 1	Bonus 1	Bonus 1	Bonus 1
	Number of bonus payments	22	Bonus 2	Bonus 2	Bonus 2	Bonus 2	Bonus 2	Bonus 2	Bonus 2
	Bonus month(s)	23	Bonus 3	Bonus 3	Does not exist.	Does not exist.	Bonus 3	Bonus 3	

	Number of bonus payments	24	Bonus 4	Bonus 4	Bonus 3	Bonus 3	Bonus 4 (Up to two entries for bonus month)	Bonus 4
	Bonus month (1)							
	Bonus month (2)							
	Bonus month (3)							
	Bonus month (4)							
	Bonus month (5)							
	Bonus month (6)							

	Number of bonus payments	25	Bonus 5	Bonus 5	Does not exist.	Does not exist.	Does not exist.	Bonus 5
	Bonus month (1)							
	Bonus amount (1)							
	Bonus month (2)							
	Bonus amount (2)							
	Bonus month (3)							
	Bonus amount (3)							
	Bonus month (4)

See Also **CapPaymentDetail** Property

PaymentMedia Property **R/W** *Added in Release 1.5*

Syntax **LONG PaymentMedia;**

Remarks Stores the payment media type which the approval method should approve.

The application sets this property to one of the following values before issuing an approval method call. “None specified” means that the payment media type will be determined by the CAT device instead of the application.

Value	Meaning
CAT_MEDIA_UNSPECIFIED	No media type specified.
CAT_MEDIA_NONDEFINE	Same as CAT_MEDIA_UNSPECIFIED. Left in for compatibility for applications written to the initial draft of the CAT extensions.
CAT_MEDIA_CREDIT	Credit card.
CAT_MEDIA_DEBIT	Debit card.

This property is initialized to CAT_MEDIA_UNSPECIFIED by the **Open** method.

SequenceNumber Property

Syntax	LONG SequenceNumber;
Remarks	<p>Stores a “sequence number” as the result of each method call. This number needs to be checked by an application to see if it matches with the argument <i>SequenceNumber</i> of the originating method.</p> <p>If the “sequence number” returned from the CAT device is not numeric, the CAT control set this property to zero.</p> <p>This property is initialized to zero by the Open method and is updated when an authorization operation successfully completes</p>

SlipNumber Property

Syntax	BSTR SlipNumber;
Remarks	<p>Stores a “slip number” as the result of each authorization operation.</p> <p>This property is initialized to NULL by the Open method and is updated when an authorization operation successfully completes</p>

TrainingMode Property R/W

Syntax **BOOL TrainingMode;**

Remarks If TRUE, each operation will be run in training mode; otherwise each operation will be run in normal mode.

TrainingMode needs to be explicitly set to FALSE by an application to exit from training mode, because it will not automatically be set to FALSE after the completion of an operation.

This property will be initialized to FALSE by the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property.

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	CapTrainingMode is FALSE.

TransactionNumber Property

Syntax **BSTR TransactionNumber;**

Remarks Stores a “transaction number” as the result of each authorization operation.

This property is initialized to zero by the **Open** method and is updated when an authorization operation successfully completes

TransactionType Property

Syntax **LONG TransactionType;**

Remarks Stores a “transaction type” as the result of each authorization operation.

This property is initialized to zero by the **Open** method and is updated when an authorization operation successfully completes.

This property will be set to one of the following values.

Value	Meaning
CAT_TRANSACTION_SALES	Sales
CAT_TRANSACTION_VOID	Cancellation
CAT_TRANSACTION_REFUND	Refund purchase
CAT_TRANSACTION_COMPLETION	Purchase after approval
CAT_TRANSACTION_PRESALES	Pre-authorization
CAT_TRANSACTION_CHECKCARD	Card Check
CAT_TRANSACTION_VOIDPRESALES	Cancel pre-authorization approval

Methods

AccessDailyLog Method

Syntax **LONG AccessDailyLog (LONG *SequenceNumber*, LONG *Type*, LONG *Timeout*);**

Parameter	Description
<i>SequenceNumber</i>	The sequence number to get daily log.
<i>Type</i>	Specify whether the daily log is intermediate total or final total and erase.
<i>Timeout</i>	The maximum waiting time (in milliseconds) until the response is received from the CAT device. OPOS_FOREVER(-1), 0, and positive values can be specified.

Remarks Gets daily log from CAT.

Daily log will be retrieved and stored in **DailyLog** as specified by *SequenceNumber*.

When *Timeout* is OPOS_FOREVER(-1), timeout never occurs and the device waits until it receives response from the CAT.

Application must specify one of the following values for *Type* for daily log type (either intermediate total or adjustment). Legal values depend upon the **CapDailyLog** value.

Value	Meaning
CAT_DL_REPORTING	Intermediate total.
CAT_DL_SETTLEMENT	Final total and erase.

Return One of the following values is returned by the method and placed in the **ResultCode** property.

Value	Meaning
OPOS_SUCCESS	Acquisition processing was successful.
OPOS_E_ILLEGAL	Invalid or unsupported <i>Type</i> or <i>Timeout</i> parameter was specified, or CapDailyLog is FALSE.
OPOS_E_TIMEOUT	No response was received from CAT during the specified <i>Timeout</i> time in milliseconds.

OPOS_E_EXTENDED The detail code has been stored in **ResultCodeExtended**.

OPOS_E_BUSY The CAT device cannot accept any commands now.

Other Values See **ResultCode**.

See Also **CapDailyLog** Property, **DailyLog** Property

AuthorizeCompletion Method

Syntax **LONG AuthorizeCompletion (LONG *SequenceNumber*, CURRENCY *Amount*, CURRENCY *TaxOthers*, LONG *Timeout*);**

Parameter	Description
<i>SequenceNumber</i>	Sequence number for approval
<i>Amount</i>	Purchase amount for approval
<i>TaxOthers</i>	Tax and other amounts for approval
<i>Timeout</i>	The maximum waiting time (in milliseconds) until the response is received from the CAT device. OPOS_FOREVER(-1), 0 and positive values can be specified.

Remarks Purchase after approval is intended.

Sales after approval for *Amount* and *TaxOthers* is intended as the approval specified by *SequenceNumber*.

When *Timeout* is OPOS_FOREVER(-1), timeout never occurs and the device waits until it receives response from the CAT.

Return One of the following values is returned by the method and placed in the **ResultCode** property.

Value	Meaning
OPOS_SUCCESS	Approval processing was successful.
OPOS_E_ILLEGAL	Invalid <i>Timeout</i> parameter was specified, or CapAuthorizeCompletion is FALSE.
OPOS_E_TIMEOUT	No response was received from CAT during the specified <i>Timeout</i> time in milliseconds.
OPOS_E_EXTENDED	The detail code has been stored in ResultCodeExtended .
OPOS_E_BUSY	The CAT device cannot accept any commands now.
<i>Other Values</i>	See ResultCode .

See Also *CapAuthorizeCompletion Property*

AuthorizePreSales Method

Syntax **LONG AuthorizePreSales (LONG *SequenceNumber*, CURRENCY *Amount*, CURRENCY *TaxOthers*, LONG *Timeout*);**

Parameter	Description
<i>SequenceNumber</i>	Sequence number for approval
<i>Amount</i>	Purchase amount for approval
<i>TaxOthers</i>	Tax and other amounts for approval
<i>Timeout</i>	The maximum waiting time (in milliseconds) until the response is received from the CAT device. OPOS_FOREVER(-1), 0 and positive values can be specified.

Remarks Makes a pre-authorization.

Pre-authorization for *Amount* and *TaxOthers* is made as the approval specified by *SequenceNumber*.

When *Timeout* is OPOS_FOREVER(-1), timeout never occurs and the device waits until it receives response from the CAT.

Return One of the following values is returned by the method and placed in the **ResultCode** property.

Value	Meaning
OPOS_SUCCESS	Approval processing was successful.
OPOS_E_ILLEGAL	Invalid <i>Timeout</i> parameter was specified, or CapAuthorizePreSales is FALSE.
OPOS_E_TIMEOUT	No response was received from CAT during the specified <i>Timeout</i> time in milliseconds.
OPOS_E_EXTENDED	The detail code has been stored in ResultCodeExtended .
OPOS_E_BUSY	The CAT device cannot accept any commands now.
<i>Other Values</i>	See ResultCode .

See Also **CapAuthorizePreSales** Property

AuthorizeRefund Method

Syntax **LONG AuthorizeRefund (LONG *SequenceNumber*, CURRENCY *Amount*, CURRENCY *TaxOthers*, LONG *Timeout*);**

Parameter	Description
<i>SequenceNumber</i>	Sequence number for approval
<i>Amount</i>	Purchase amount for approval
<i>TaxOthers</i>	Tax and other amounts for approval
<i>Timeout</i>	The maximum waiting time (in milliseconds) until the response is received from the CAT device. OPOS_FOREVER(-1), 0 and positive values can be specified.

Remarks Refund purchase approval is intended.

Refund purchase approval for *Amount* and *TaxOthers* is intended as the approval specified by *SequenceNumber*.

When *Timeout* is OPOS_FOREVER(-1), timeout never occurs and the device waits until it receives response from the CAT.

Return One of the following values is returned by the method and placed in the **ResultCode** property.

Value	Meaning
OPOS_SUCCESS	Approval processing was successful.
OPOS_E_ILLEGAL	Invalid <i>Timeout</i> parameter was specified, or CapAuthorizeRefund is FALSE.
OPOS_E_TIMEOUT	No response was received from CAT during the specified <i>Timeout</i> time in milliseconds.
OPOS_E_EXTENDED	The detail code has been stored in ResultCodeExtended .
OPOS_E_BUSY	The CAT device cannot accept any commands now.
<i>Other Values</i>	See ResultCode .

See Also **CapAuthorizeRefund** Property

AuthorizeSales Method

Syntax **LONG AuthorizeSales (LONG *SequenceNumber*, CURRENCY *Amount*, CURRENCY *TaxOthers*, LONG *Timeout*);**

Parameter	Description
<i>SequenceNumber</i>	Sequence number for approval
<i>Amount</i>	Purchase amount for approval
<i>TaxOthers</i>	Tax and other amounts for approval
<i>Timeout</i>	The maximum waiting time (in milliseconds) until the response is received from the CAT device. OPOS_FOREVER(-1), 0 and positive values can be specified.

Remarks Normal purchase approval is intended.

Normal purchase approval for *Amount* and *TaxOthers* is intended as the approval specified by *SequenceNumber*.

When *Timeout* is OPOS_FOREVER(-1), timeout never occurs and the device waits until it receives response from the CAT.

Return One of the following values is returned by the method and placed in the **ResultCode** property.

Value	Meaning
OPOS_SUCCESS	Approval processing was successful.
OPOS_E_ILLEGAL	Invalid <i>Timeout</i> parameter was specified.
OPOS_E_TIMEOUT	No response was received from CAT during the specified <i>Timeout</i> time in milliseconds.
OPOS_E_EXTENDED	The detail code has been stored in ResultCodeExtended .
OPOS_E_BUSY	The CAT device cannot accept any commands now.
<i>Other Values</i>	See ResultCode .

AuthorizeVoid Method

Syntax **LONG AuthorizeVoid (LONG *SequenceNumber*, CURRENCY *Amount*, CURRENCY *TaxOthers*, LONG *Timeout*);**

Parameter	Description
<i>SequenceNumber</i>	Sequence number for approval
<i>Amount</i>	Purchase amount for approval
<i>TaxOthers</i>	Tax and other amounts for approval
<i>Timeout</i>	The maximum waiting time (in milliseconds) until the response is received from the CAT device. OPOS_FOREVER(-1), 0 and positive values can be specified.

Remarks Purchase cancellation approval is intended.

Cancellation approval for *Amount* and *TaxOthers* is intended as the approval specified by *SequenceNumber*.

When *Timeout* is OPOS_FOREVER(-1), timeout never occurs and the device waits until it receives response from the CAT.

Return One of the following values is returned by the method and placed in the **ResultCode** property.

Value	Meaning
OPOS_SUCCESS	Approval processing was successful.
OPOS_E_ILLEGAL	Invalid <i>Timeout</i> parameter was specified, or CapAuthorizeVoid is FALSE.
OPOS_E_TIMEOUT	No response was received from CAT during the specified <i>Timeout</i> time in milliseconds.
OPOS_E_EXTENDED	The detail code has been stored in ResultCodeExtended .
OPOS_E_BUSY	The CAT device cannot accept any commands now.
<i>Other Values</i>	See ResultCode .

See Also **CapAuthorizeVoid** Property

AuthorizeVoidPreSales Method

Syntax **LONG AuthorizeVoidPreSales (LONG *SequenceNumber*, CURRENCY *Amount*, CURRENCY *TaxOthers*, LONG *Timeout*);**

Parameter	Description
<i>SequenceNumber</i>	Sequence number for approval
<i>Amount</i>	Purchase amount for approval
<i>TaxOthers</i>	Tax and other amounts for approval
<i>Timeout</i>	The maximum waiting time (in milliseconds) until the response is received from the CAT device. OPOS_FOREVER(-1), 0 and positive values can be specified.

Remarks Pre-authorization cancellation approval is intended.

Pre-authorization cancellation approval for *Amount* and *TaxOthers* is intended as the approval specified by *SequenceNumber*.

When *Timeout* is OPOS_FOREVER(-1), timeout never occurs and the device waits until it receives response from the CAT.

Normal cancellation could be used for CAT control and CAT devices which have not implemented the pre-authorization approval cancellation. Refer to the documentation supplied with CAT device and / or CAT control.

Return One of the following values is returned by the method and placed in the **ResultCode** property.

Value	Meaning
OPOS_SUCCESS	Approval processing was successful.
OPOS_E_ILLEGAL	Invalid <i>Timeout</i> parameter was specified, or CapAuthorizeVoidPreSales is FALSE.
OPOS_E_TIMEOUT	No response was received from CAT during the specified <i>Timeout</i> time in milliseconds.
OPOS_E_EXTENDED	The detail code has been stored in ResultCodeExtended .
OPOS_E_BUSY	The CAT device cannot accept any commands now.
<i>Other Values</i>	See ResultCode .

See Also **CapAuthorizeVoidPreSales** Property

CheckCard Method

Syntax **LONG CheckCard (LONG *SequenceNumber*, LONG *Timeout*);**

Parameter	Description
<i>SequenceNumber</i>	Sequence number for approval
<i>Timeout</i>	The maximum waiting time (in milliseconds) until the response is received from the CAT device. OPOS_FOREVER(-1), 0 and positive values can be specified.

Remarks Card Check is intended.

Card Check will be made as specified by *SequenceNumber*.

When *Timeout* is OPOS_FOREVER(-1), timeout never occurs and the device waits until it receives response from the CAT.

Return One of the following values is returned by the method and placed in the **ResultCode** property.

Value	Meaning
OPOS_SUCCESS	Approval processing was successful.
OPOS_E_ILLEGAL	Invalid <i>Timeout</i> parameter was specified, or CapCheckCard is FALSE.
OPOS_E_TIMEOUT	No response was received from CAT during the specified <i>Timeout</i> time in milliseconds.
OPOS_E_EXTENDED	The detail code has been stored in ResultCodeExtended .
OPOS_E_BUSY	The CAT device cannot accept any commands now.
<i>Other Values</i>	See ResultCode .

See Also **CapCheckCard** Property

Events

ErrorEvent Event

Syntax **void ErrorEvent (LONG ResultCode, LONG ResultCodeExtended, LONG ErrorLocus, LONG* pErrorResponse);**

Parameter	Description
<i>ResultCode</i>	The code which caused the error event. Remarks ResultCode for the value.
<i>ResultCodeExtended</i>	The extended code which caused the error event. Remarks the value below for the value.
<i>ErrorLocus</i>	OPOS_EL_OUTPUT is specified. An error occurred during asynchronous action.
<i>pErrorResponse</i>	Pointer to the error event response. Remarks the value below.

If **ResultCode** is OPOS_E_EXTENDED, **ResultCodeExtended** will be set to one of the following values.

Value	Meaning
OPOS_ECAT_CENTERERROR	An error was returned from the approval agency. The detail error code is defined in CenterResultCode .
OPOS_ECAT_COMMANDERROR	The command sent to CAT is wrong. This error is never returned so long as CAT control is working correctly.
OPOS_ECAT_RESET	CAT was stopped during processing by CAT reset key (stop key) and so on.
OPOS_ECAT_COMMUNICATIONERROR	Communication error has occurred between the approval agency and CAT.
OPOS_ECAT_DAILYLOGOVERFLOW	Daily log was too big to be stored. Keeping daily log has been stopped and the value of DailyLog property is uncertain.

The content of the position specified by *pErrorResponse* will be preset to the default value of OPOS_ER_RETRY. An application sets one of the following values.

Value	Meaning
OPOS_ER_RETRY	Retries the asynchronous processing. The error state is exited.
OPOS_ER_CLEAR	Clear the asynchronous processing. The error state is exited.

Remarks Fired when an error is detected while processing an asynchronous authorize group method or the **AccessDailyLog** method. The control's **State** transitions into the error state.

See Also Status, **ResultCode**, and State Model

General Information

The Coin Dispenser Control's OLE programmatic ID is "OPOS.CoinDispenser".

Capabilities

The coin dispenser has the following capability:

- Supports a method that allows a specified amount of change to be dispensed from the device.

The coin dispenser may have the following additional capability:

- Coin dispenser status reporting, which indicates empty coin slot conditions, near empty coin slot conditions, and coin slot jamming conditions.

Model

The general model of a coin dispenser is:

- A coin dispenser consists of a number of coin slots which hold the coinage to be dispensed. The programmer using the Coin Dispenser Control is not concerned with controlling the individual slots of coinage, but rather calls a method with the amount of change to be dispensed. It is the responsibility of the coin dispenser device or the Control to dispense the proper amount of change from the various slots.

Device Sharing

The coin dispenser is an exclusive-use device. Its device sharing rules are:

- The application must claim the device before enabling it.
- The application must claim and enable the device before accessing some of the properties, dispensing change, or receiving status update events.
- See the "Summary" table for precise usage prerequisites.

Properties

CapEmptySensor Property

Syntax	BOOL CapEmptySensor;
Remarks	If TRUE, the coin dispenser can report an out-of-coinage condition; otherwise it is FALSE. This property is initialized by the Open method.

CapJamSensor Property

Syntax	BOOL CapJamSensor;
Remarks	If TRUE, the coin dispenser can report a mechanical jam or failure condition; otherwise it is FALSE. This property is initialized by the Open method.

CapNearEmptySensor Property

Syntax	BOOL CapNearEmptySensor;
Remarks	If TRUE, the coin dispenser can report when it is almost out of coinage; otherwise it is FALSE. This property is initialized by the Open method.

DispenserStatus Property

Syntax **LONG DispenserStatus;**

Remarks Holds the current status of the dispenser. It may be one of the following:

Value	Meaning
COIN_STATUS_OK	Ready to dispense coinage. This value is also set when the dispenser is unable to detect an error condition.
COIN_STATUS_EMPTY	Cannot dispense coinage because it is empty.
COIN_STATUS_NEAREMPTY	Can still dispense coinage, but it nearly empty.
COIN_STATUS_JAM	A mechanical fault has occurred.

This property is initialized and kept current while the device is enabled.

Methods

DispenseChange Method

Syntax **LONG DispenseChange (LONG *Amount*);**

The *Amount* parameter contains the amount of change to be dispensed.

Remarks Call to dispense change. The value represented by the *Amount* parameter is a count of the currency units to dispense (such as cents or yen).

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The specified change was dispensed successfully.
OPOS_E_ILLEGAL	An <i>Amount</i> parameter value of zero was specified, or the <i>Amount</i> parameter contained a negative value or a value greater than the device can dispense.
<i>Other Values</i>	See ResultCode .

Events

StatusUpdateEvent

Syntax **void StatusUpdateEvent (LONG Status);**

The *Status* parameter contains the coin dispenser status condition:

Value	Meaning
COIN_STATUS_OK	Ready to dispense coinage. This value is also set when the dispenser is unable to detect an error condition.
COIN_STATUS_EMPTY	Cannot dispense coinage because it is empty.
COIN_STATUS_NEAREMPTY	Can still dispense coinage, but is nearly empty.
COIN_STATUS_JAM	A mechanical fault has occurred.

Power reporting StatusUpdateEvent values

See **StatusUpdateEvent** description on page 74.

Remarks Fired when a coin dispenser sensor indicates a status change.

The coin dispenser is only able to fire status event changes for the sensor types supported by the values described in the capabilities properties.

CHAPTER 7

Fiscal Printer

Summary

Properties

<i>Common</i>	<i>Ver</i>	<i>Type</i>	<i>Access</i>	<i>May Use After</i>

All methods and properties marked with ⁽¹⁾ are specific to at least one particular country and are not required by the fiscal legislation of all countries.

Properties and methods marked with ⁽²⁾ are adapted from the POS Printer device.

General Information

The Fiscal Printer Control's OLE programmatic ID is "OPOS.FiscalPrinter".

This device was added in OPOS Release 1.3.

The fiscal printer OLE Control does not attempt to encapsulate the generic Windows graphics printer. Rather, for performance and ease of use considerations, the interfaces are defined to directly control the normal printer functions.

Since fiscal rules differ between countries, this interface tries to generalize the common requirements at the maximum extent specifications. This interface is based upon the fiscal requirements of the following countries, but it may fit the needs of other countries as well:

- Brazil
- Bulgaria
- Greece
- Hungary
- Italy
- Poland
- Romania
- Russia
- Turkey

The Fiscal Printer model defines three stations with the following general uses:

- **Journal** Used for simple text to log transaction and activity information. Kept by the store for audit and other purposes.
- **Receipt** Used to print transaction information. It is mandatory to give a printed fiscal receipt to the customer. Also often used for store reports. Contains either a knife to cut the paper between transactions, or a tear bar to manually cut the paper.
- **Slip** Used to print information on a form. Usually given to the customer.

The **Slip** station is also used to print "validation" information on a form. The form type is typically a check or credit card slip.

It may also be used to print complete transaction information instead of printing it on the receipt.

Sometimes, limited forms-handling capability is integrated with the receipt or journal station to permit validation printing. Often this limits the number of print lines, due to station's forms-handling throat depth. The Fiscal Control nevertheless addresses this printer functionality as a slip station.

Configuration and initialization of the fiscal memory of the Fiscal Printer are not covered in this specification. These low level operations must be performed by authorized technical assistance personnel.

Device Sharing

The Fiscal Printer is an exclusive-use device, as follows:

- The application must claim the device before enabling it.
- The application must claim and enable the device before accessing many Fiscal Printer-specific properties.
- The application must claim and enable the device before calling methods that manipulate the device.

General requirements

Fiscal Printers do not simply print text similar to standard printers. They are used to monitor and memorize all fiscal information about a sale transaction. A Fiscal Printer has to accumulate totals, discounts, number of canceled receipts, taxes, etc. and has to store this information in different totalizers, counters and the fiscal memory. In order to perform these functions, it is not sufficient to send unformatted strings of text to the Fiscal Printer; there is a need to separate each individual field in a receipt line item, thus differentiating between descriptions, prices and discounts. Moreover, it is necessary to define different printing commands for each different sale functionality (such as refund, item or void).

Fiscal rules are different among countries. This interface tries to generalize these requirements by summarizing the common requirements. Fiscal law requires that:

- Fiscal receipts must be printed and given to the customer.
- Fiscal Printers must be equipped with memory to store daily totals. Each receipt line item must increment totals registers and, in most countries (Greece, Poland, Brazil, Hungary Romania, Bulgaria, Russia and Turkey) tax registers as well.
- Discounts, canceled items and canceled receipts must increment their associated registers on the Fiscal Printer.
- Fiscal Printer must include a clock to store date and time information relative to each single receipt.
- Each fiscal receipt line item is printed both on the receipt and on the journal (Italy, Greece, Poland), but as an extension it can also be printed on the slip and journal.
- After a power failure (or a turn off) the Fiscal Printer must be in the same state as it was before this event occurred. This implies that care must be taken in managing the Fiscal Printer status and that power failure events must be managed by the application. In some countries a power failure must be logged and a report must be printed.

Fiscal Printer Modes

According to fiscal rules, it is possible for a Fiscal Printer to also offer functionality beyond the required fiscal printing mode. These additional modes are optional and may or may not be present on any particular Fiscal Printer.

There are three possible Fiscal Printer modes:

- **Fiscal:** This is the only required mode for a Fiscal Printer. In this mode the application has access to all the methods needed to manage a sale transaction and to print a fiscal receipt. It is assumed that any lines printed to the receipt station while in fiscal mode are also printed on the journal station.
- **Training:** In this mode the Fiscal Printer is used for training purposes (such as cashier training). In this mode the Fiscal Printer will accept fiscal commands but the printer will indicate on each receipt or document that the transaction is not an actual fiscal transaction. The Fiscal Printer will not update any of its internal fiscal registers while in training mode. Such printed receipts are usually marked as “training” receipts by Fiscal Printers.
CapTrainingMode property will be TRUE if the Fiscal Printer supports training mode; otherwise it is FALSE.
- **Non-Fiscal:** In this mode the Fiscal Printer can be used to print simple text on the receipt station (echoed on the journal station) or the slip station. The Fiscal Printer will print some additional lines along with the application requested output to indicate that this output is not of a fiscal nature. Such printed receipts are usually marked as “non-fiscal” receipts by Fiscal Printers.
CapNonFiscalMode property will be TRUE if the Fiscal Printer supports non-fiscal printing; otherwise it is FALSE.

Model

The Fiscal Printer follows the general output model for devices, with some enhancements:

- Most methods are always performed synchronously. Synchronous methods will fail if asynchronous output is outstanding.
- The following methods are performed either synchronously or asynchronously, depending on the value of the **AsyncMode** property:

PrintFiscalDocumentLine
PrintFixedOutput
PrintNormal
PrintRecCash
PrintRecItem
PrintRecItemAdjustment
PrintRecItemFuel
PrintRecItemFuelVoid
PrintRecMessage
PrintRecNotPaid
PrintRecPackageAdjustment
PrintRecPackageAdjustVoid
PrintRecRefund
PrintRecRefundVoid
PrintRecSubtotal
PrintRecSubtotalAdjustment
PrintRecSubtotalAdjustVoid
PrintRecTaxID
PrintRecTotal
PrintRecVoid
PrintRecVoidItem

When **AsyncMode** is FALSE, then these methods print synchronously and return their completion status to the application.

When **AsyncMode** is TRUE, then these methods operate as follows:

- ◆ The Control buffers the request, sets the **OutputID** property to an identifier for this request, and returns as soon as possible. When the device completes the request successfully, the **OutputCompleteEvent** is enqueued. A parameter of this event contains the **OutputID** of the completed request.

Asynchronous Fiscal Printer methods will not return an error status due to a printing problem, such as out of paper or Fiscal Printer fault. These errors will only be reported by an **ErrorEvent**. An error status is returned only if the Fiscal Printer is not claimed and enabled, a parameter is invalid, or the request cannot be enqueued. The first two error cases are due to an application error, while the last is a serious system resource exception.

- ◆ If an error occurs while performing an asynchronous request, an **ErrorEvent** is enqueued and delivered. The **ErrorStation** property is set to the station or stations that were printing when the error occurred. The **ErrorLevel**, **ErrorString** and **ErrorState** and **ErrorOutID** properties are also set.

The event handler may call synchronous print methods (but not asynchronous methods), then can either retry the outstanding output or clear it.

- ◆ The Control guarantees that asynchronous output is performed on a first-in first-out basis.
- ◆ All output buffered by OPOS may be deleted by calling the **ClearOutput** method. **OutputCompleteEvents** will not be delivered for cleared output. This method also stops any output that may be in progress (when possible).
- ◆ The property **FlagWhenIdle** may be set to cause a **StatusUpdateEvent** to be enqueued when all outstanding outputs have finished, whether successfully or because they were cleared.

Error Model

The Fiscal Printer error reporting model is as follows:

- Most of the Fiscal Printer error conditions are reported by setting the **ResultCode** to OPOS_E_EXTENDED and then setting **ResultCodeExtended** to one of the following error conditions:

OPOS_EFPTR_COVER_OPEN

The Fiscal Printer cover is open.

OPOS_EFPTR_JRN_EMPTY

The journal station has run out of paper.

OPOS_EFPTR_REC_EMPTY

The receipt station has run out of paper.

OPOS_EFPTR_SLP_EMPTY

The slip station has run out of paper.

OPOS_EFPTR_MISSING_DEVICES:

Some of the other devices which according to the local fiscal legislation are to be connected are missing. In some countries in order to use a Fiscal Printer a full set of peripheral devices are to be connected to the POS (such as cash drawer and customer display). In case one of these devices is not present, sales are not allowed.

OPOS_EFPTR_WRONG_STATE

The requested method could not be executed in the Fiscal Printer's current state.

OPOS_EFPTR_TECHNICAL_ASSISTANCE

The Fiscal Printer has encountered a severe error condition. Calling for Fiscal Printer technical assistance is required.

OPOS_EFPTR_CLOCK_ERROR

The Fiscal Printer's internal clock has failed.

OPOS_EFPTR_FISCAL_MEMORY_FULL

The Fiscal Printer's fiscal memory has been exhausted.

OPOS_EFPTR_FISCAL_MEMORY_DISCONNECTED

The Fiscal Printer's fiscal memory has been disconnected.

OPOS_EFPTR_FISCAL_TOTALS_ERROR

The Grand Total in working memory does not match the one in the EPROM.

OPOS_EFPTR_BAD_ITEM_QUANTITY

The Quantity parameter is invalid.

OPOS_EFPTR_BAD_ITEM_AMOUNT

The Amount parameter is invalid.

OPOS_EFPTR_BAD_ITEM_DESCRIPTION

The Description parameter is either too long, contains illegal characters or contains a reserved word.

OPOS_EFPTR_RECEIPT_TOTAL_OVERFLOW

The receipt total has overflowed.

OPOS_EFPTR_BAD_VAT

The Vat parameter is invalid.

OPOS_EFPTR_BAD_PRICE

The Price parameter is invalid.

OPOS_EFPTR_BAD_DATE

The date parameter is invalid.

OPOS_EFPTR_NEGATIVE_TOTAL

The Fiscal Printer's computed total or subtotal is less than zero.

OPOS_EFPTR_WORD_NOT_ALLOWED

The description contains the reserved word.

OPOS_EFPTR_BAD_LENGTH

The length of the string to be printed as post or pre line is too long.

OPOS_EFPTR_MISSING_SET_CURRENCY

The Fiscal Printer is expecting the activation of a new currency.

- Other Fiscal Printer errors are reported by setting the **ResultCode** to **OPOS_E_FAILURE** or another standard error status. These failures are typically due to a Fiscal Printer fault or jam, or to a more serious error.

Fiscal Printer States

As previously described, a Fiscal Printer is characterized by different printing modes. Moreover, the set of commands that can be executed at a particular moment depends upon the current state of the Fiscal Printer.

The current state of the Fiscal Printer is kept in the **PrinterState** property.

The Fiscal Printer has the following states:

- **Monitor:**
This is a neutral state. From this state it is possible to move to most of the other Fiscal Printer states. After a successful call to the **ClaimDevice** method and successful setting of the **DeviceEnabled** property to TRUE the Fiscal Printer should be in this state unless there is a Fiscal Printer error.
- **Fiscal Receipt:**
The Fiscal Printer is processing a fiscal receipt. All **PrintRec...** methods except **PrintRecMessage**, **PrintRecNotPaid** and **PrintRecTaxID** are available for use while in this state. This state is entered from the **Monitor** state using the **BeginFiscalReceipt** method.
- **Fiscal Receipt Total:**
The Fiscal Printer has already accepted at least one payment method, but the receipt's total amount has not yet been tendered. This state is entered from the **Fiscal Receipt** state by use of the **PrintRecTotal** method. The Fiscal Printer remains in this state while the total remains unpaid. This state can be left by using the **PrintRecTotal**, **PrintRecNotPaid** or **PrintRecVoid** methods.
- **Fiscal Receipt Ending:**
The Fiscal Printer has completed the receipt up to the **Total** line. In this state it may be possible to print general messages using the **PrintRecMessage** method or to print tax information using the **PrintRecTaxID** method if this is supported by the Fiscal Printer. This state is entered from the **Fiscal Receipt** state via the **PrintRecVoid** method or from the **Fiscal Receipt Total** state using either the **PrintRecTotal**, **PrintRecNotPaid** or **PrintRecVoid** methods. This state is exited using the **EndFiscalReceipt** method at which time the Fiscal Printer returns to the **Monitor** state.
- **Fiscal Document:**
The Fiscal Printer is processing a fiscal document. The Fiscal Printer will accept the **PrintFiscalDocumentLine** method while in this state. This state is entered from the **Monitor** state using the **BeginFiscalDocument** method. This state is exited using the **EndFiscalDocument** method at which time the Fiscal Printer returns to the **Monitor** state.

- **Monitor and TrainingModeActive = TRUE:**
The Fiscal Printer is being used for training purposes. All fiscal receipt and document commands are available. This state is entered from the **Monitor** state using the **BeginTraining** method. This state is exited using the **EndTraining** method at which time the Fiscal Printer returns to the **Monitor** state.
- **Fiscal Receipt and TrainingModeActive = TRUE:**
The Fiscal Printer is being used for training purposes and a receipt is currently opened. To each line of the receipt special text will be added in order to differentiate it from a fiscal receipt.
- **Fiscal Total and TrainingModeActive = TRUE:**
The Fiscal Printer is in training mode and receipt total is being handled.
- **Fiscal ReceiptEnding and TrainingModeActive = TRUE:**
The Fiscal Printer is being used for training in the receipt ending phase.
- **NonFiscal:**
The Fiscal Printer is printing non-fiscal output on either the receipt (echoed on the journal) or the slip. In this state the Fiscal Printer will accept the **PrintNormal** method. The Fiscal Printer prints a message that indicates that this is non-fiscal output with all application text. This state is entered from the **Monitor** state using the **BeginNonFiscal** method. This state is exited using the **EndNonFiscal** method at which time the Fiscal Printer returns to the **Monitor** state.
- **Fixed:**
The Fiscal Printer is being used to print fixed, non-fiscal output to one of the Fiscal Printer's stations. In this state the Fiscal Printer will accept the **PrintFixedOutput** method. This state is entered from the **Monitor** state using the **BeginFixedOutput** method. This state is exited using the **EndFixedOutput** method at which time the Fiscal Printer returns to the **Monitor** state.
- **ItemList:**
The Fiscal Printer is currently printing a line item report. In this state the Fiscal Printer will accept the **VerifyItem** method. This state is entered from the **Monitor** state using the **BeginItemList** method. This state is exited using the **EndItemList** method at which time the Fiscal Printer returns to the **Monitor** state.
- **Report:**
The Fiscal Printer is currently printing one of the supported types of reports. This state is entered from the **Monitor** state using one of the **PrintReport**, **PrintPeriodicTotalsReport**, **PrintPowerLossReport**, **PrintXReport** or **PrintZReport** methods. When the report print completes, the Fiscal Printer automatically returns to **Monitor** state.
- **FiscalSystemBlocked:**
The Fiscal Printer is no longer operational due to one of the following reasons:

- ◆ The Fiscal Printer has been disconnected or has lost power.
- ◆ The Fiscal Printer's fiscal memory has been exhausted.
- ◆ The Fiscal Printer's internal data has become inconsistent.

In this state the Fiscal Printer will only accept methods to print reports and retrieve data. The Fiscal Printer cannot exit this state without the assistance of an authorized technician.

When the application sets the property **DeviceEnabled** to TRUE it also monitors its current state. In a standard situation, the **PrinterState** property is set to FPTR_PS_MONITOR after a successfully setting **DeviceEnabled** to TRUE. This indicates that there was no interrupted operation remaining in the Fiscal Printer.

If the Fiscal Printer is not in the FPTR_PS_MONITOR state, the state reflects the Fiscal Printer's interrupted operation and the **PowerState** property is set to OPOS_PS_OFF. In this situation it is necessary to force the Fiscal Printer to a normal state by calling the **ResetPrinter** method.

This means that a power failure occurred or the last application which accessed the device left it in a not clear state.

Notice that even in this case the **ResultCode** property will be set to OPOS_SUCCESS after setting **DeviceEnabled** to TRUE. It is required that the application checks the **PowerState** property and checks for a received **StatusUpdateEvent** with the value OPOS_SUE_POWER_OFF in the Data argument after successfully setting the **DeviceEnabled** property.

Document Printing

Using a Fiscal Printer's slip station it may be possible (depending upon the Fiscal Printer's capabilities and on special fiscal rules) to print the following kinds of documents:

- **Fiscal Documents:**

In order to print fiscal documents an amount value must be sent to the Fiscal Printer and recorded by it. **CapSlpFiscalDocument** will be TRUE if the Fiscal Printer supports printing fiscal documents, and FALSE otherwise. If fiscal documents are supported they may be either full length (if **CapSlpFullSlip** is TRUE) or validation (if **CapSlpValidation** is TRUE). The actual selection is made using the **SlipSelection** property but only one totalizer is assigned to all the fiscal documents.

A fiscal document is started using the **BeginFiscalDocument** method and terminated by using the **EndFiscalDocument** method. A line is printed using the **PrintFiscalDocumentLine** method.

- **Non-Fiscal Full Length Documents:**

Full length slip documents may be printed if **CapSlpFullSlip** is TRUE and **SlipSelection** is set to FPTR_SS_FULL_LENGTH.

This document is started using the **BeginNonFiscal** method and terminated by using the **EndNonFiscal** method. A line is printed using the **PrintNormal** method.

- **Non-Fiscal Validation Documents:**

Validation documents may be printed if **CapSlpValidation** is TRUE and **SlipSelection** is set to FPTR_SS_VALIDATION.

This document is started using the **BeginNonFiscal** method and terminated by using the **EndNonFiscal** method. A line is printed using the **PrintNormal** method.

- **Fixed Text Documents:**

Fixed text documents may be printed if **CapFixedOutput** is TRUE. If fixed text documents are supported they may be either full length (if **CapSlpFullSlip** is TRUE) or validation (if **CapSlpValidation** is TRUE). The actual selection is made using the **SlipSelection** property.

Ordering of Fiscal Receipt Print Requests

A fiscal receipt is started using the **BeginFiscalReceipt** method.

Each fiscal receipt consists of a mandatory receipt header and a mandatory receipt trailer, normally with the country specific logotype. If **CapFiscalReceiptType** is TRUE the type of a fiscal receipt may be specified by the **FiscalReceiptType** property.

The following receipt types are defined:

- **Retail Sales Receipt:**
The daily totalizers are updated, the **PrintRec...** methods must be used.
- **Simplified Invoice Receipt:**
The daily totalizers are updated, a special title is printed, the **PrintRec...** methods can be used, except the **PrintRecRefund** and **PrintRecRefundVoid** methods.
- **Service Sales Receipt:**
The daily totalizers are updated, but a special header line is printed to identify the type of receipt. The **PrintRec...** methods must be used.
- **Generic Receipt:**
Free text can be printed using **PrintNormal** method, no totalizer is updated. A special header line is printed to identify the type of receipt.
- **Cash-In Receipt:**
This type of receipt helps to reconcile the cash amount. The cash-in amount is incremented by the amount given as an argument to the **PrintRecCash** method. Free text can be printed using **PrintNormal** method, the receipt can be cancelled.
- **Cash-Out Receipt:**
This type of receipt helps to reconcile the cash amount. The cash-in amount is decremented by the amount given as an argument to the **PrintRecCash** method. Free text can be printed using **PrintNormal** method, the receipt can be cancelled.

If the **CapIndependentHeader** property is true, then it is up to the application to decide if the fiscal receipt header lines are to be printed at this time or not. Otherwise header lines are printed immediately prior to the first line item inside a fiscal receipt. Printing the header lines at this time will decrease the amount of time required to process the first fiscal receipt print method, but it may result in more receipt voids as well. The **BeginFiscalReceipt** method may only be called if the Fiscal Printer is currently in the **Monitor** state and this call will change the Fiscal Printer's current state to Fiscal Receipt.

Before selling the first line item it is possible to exit from the Fiscal Receipt state by calling the **EndFiscalReceipt** method. If header lines have already been printed, this method will cause also receipt voiding.

Once when a Retail Sales Receipt is selected and the first line item has been printed, the Fiscal Printer remains in the Fiscal Receipt state and the following fiscal print methods are available:

PrintRecItem
PrintRecItemAdjustment
PrintRecItemFuel
PrintRecItemFuelVoid
PrintRecPackageAdjustment
PrintRecPackageAdjustVoid
PrintRecRefund
PrintRecRefundVoid
PrintRecSubtotal
PrintRecSubtotalAdjustment
PrintRecSubtotalAdjustVoid
PrintRecTotal
PrintRecVoid
PrintRecVoidItem

The **PrintRecItem**, **PrintRecItemAdjustment**, **PrintRecItemFuel**, **PrintRecItemFuelVoid**, **PrintRecPackageAdjustment**, **PrintRecPackageAdjustVoid**, **PrintRecRefund**, **PrintRecRefundVoid**, **PrintRecSubtotal**, **PrintRecSubtotalAdjustment**, **PrintRecSubtotalAdjustVoid** and **PrintRecVoidItem** will leave the Fiscal Printer in the Fiscal Receipt state. The **PrintRecTotal** method will change the Fiscal Printer's state to either Fiscal Receipt Total or Fiscal Receipt Ending, depending upon whether the entire receipt total has been met. The **PrintRecVoid** method will change the Fiscal Printer's state to Fiscal Receipt Ending.

While in the Fiscal Receipt Total state the following fiscal print methods are available:

PrintRecNotPaid
PrintRecTotal
PrintRecVoid

The **PrintRecNotPaid** (only available if the **CapReceiptNotPaid** property is TRUE) and **PrintRecTotal** methods will either leave the printer in the Fiscal Receipt Total state or change the printer's state to Fiscal Receipt Ending, depending upon whether the entire receipt total has been met. The **PrintRecVoid** method will change the Fiscal Printer's state to Fiscal Receipt Ending.

While in the Fiscal Receipt Ending state the following fiscal methods are available:

PrintRecMessage
PrintRecTaxID
EndFiscalReceipt

The **PrintRecMessage** (only available if **CapAdditionalLines** is TRUE) and **PrintRecTaxID** methods will leave the Fiscal Printer in the Fiscal Receipt Ending state. The **EndFiscalReceipt** will cause receipt closing and will then change the Fiscal Printer's state to Monitor.

Be aware that at no time can the Fiscal Printer's total for the receipt be negative. If this occurs the printer will generate an error.

Fiscal Receipt Layouts

The following is an example of a typical fiscal receipt layout:

- **Header Lines:**
Header lines contain all of the information about the store, such as telephone number, address and name of the store. All of these lines are fixed and are defined before selling the first item (using the **SetHeaderLine** method). If **CapMultiContractor** property is TRUE, two sets of header lines can be defined, assigned to the value of the **ContractorId** property. These lines may either be printed when the **BeginFiscalReceipt** method is called or when the first fiscal receipt method is called.
- **Additional Header Lines:**
Header lines defined by the **AdditionalHeader** property to be printed after the fixed header lines when the **BeginFiscalReceipt** method is called.
- **Transaction Lines:**
All of the lines of a fiscal transaction, such as line items, discounts and surcharges. Optionally they may be assigned to a specific contractor.
- **Total Line:**
The line containing the transaction total, tender amounts and possibly change due.
- **Message Lines:**
These are lines printed after the Total Line using the **PrintRecMessage** method.
- **Trailer Lines:**
These are fixed promotional messages stored on the Fiscal Printer (using the **SetTrailerLine** method). They are automatically printed when the **EndFiscalReceipt** method is called. In fact, depending upon fiscal legislation and upon the Fiscal Printer vendor, the relative position of the trailer and the fiscal logotype lines can vary.
- **Fiscal Lines:**
These are lines containing information to be inserted in the receipt due to fiscal legislations like the fiscal logotype, date, time and serial number. They are also printed automatically when the **EndFiscalReceipt** method is called.
- **Additional Trailer Lines:**
These are receipt specific information defined in the **AdditionalTrailer** property to be printed after the Fiscal Lines on the receipt before cutting it, when the **EndFiscalReceipt** method is called.

Example of a fiscal receipt

<u>Fiscal receipt</u>	<u>Definition of the line</u>	<u>OPOS methods and properties</u>
<div> <div>name of the store</div> <div>address</div> <div>ZIP code and place</div> <div>fiscal identification of the store</div> <div>Good Morning</div> </div>	fixed header	BeginFiscalReceipt data stored with SetHeaderLine and SetFiscalID AdditionalHeader property

Totalizers and Fiscal Memory

The Fiscal Printer is able to select the fiscal relevant data and to accumulate and store them in following types of totalizers:

- **Receipt Totalizers:**
The different kind of amounts of the current receipt are accumulated in receipt totalizers.
- **Day Totalizers:**
At the end of a fiscal receipt, when calling the **EndFiscalReceipt** method, the receipt totalizers are added to the day totalizers where the totals of a fiscal period (day) are summarized. The contents of the current day totalizers are printed when calling the **PrintXReport** method. At the end of a fiscal day or period totalizers are printed when calling **PrintZReport** method.
- **Document Totalizers:**
The different kind of amounts of the current document are accumulated in document totalizers.
- **Grand Totalizers:**
Some of the totalizers are stored in the fiscal memory at the end of a fiscal period when calling the **PrintZReport** method. These are the grand totalizers. The application may print the contents of the fiscal memory by calling **PrintReport** method.

The application may fetch the different totalizers using the **GetData** method or the **GetTotalizer** method, whereas the type of the totalizer can be specified by setting the **TotalizerType** property and the assignment to a contractor by setting the **ContractorId** property.

Counters

The Fiscal Printer is able to count some features of fiscal receipt and documents. The application may fetch the different counters using the **GetData** method.

VAT Tables

Some Fiscal Printers support storing VAT (Value Added Tax) tables in the Fiscal Printer's memory. Some of these Fiscal Printers will allow the application to set and modify any of the table entries. Others allow only adding new table entries but do not allow existing entries to be modified. Some Fiscal Printers allow the VAT table to be set only once.

If the Fiscal Printer supports VAT tables, **CapHasVatTable** is TRUE. If the Fiscal Printer allows the VAT table entries to be set or modified **CapSetVatTable** is TRUE. The maximum number of different vat rate entries in the VAT table is given by the **NumVatRates** property. VAT tables are set through a two step process. First the application uses the **SetVatValue** method to set each table entry to be sent to the printer. Next, the **SetVatTable** method is called to send the entire VAT table to the Fiscal Printer at one time.

Receipt Duplication

In some countries fiscal legislation can allow printing more than one copy of the same receipt. The **CapDuplicateReceipt** property will be TRUE if the Fiscal Printer is capable of printing duplicate receipts. Then, setting **DuplicateReceipt** to TRUE causes the buffering of all receipt printing commands. **DuplicateReceipt** is set FALSE after receipt closing. In order to print the receipt again the **PrintDuplicateReceipt** method has to be called.

CURRENCY amounts, percentage amounts, VAT rates, and quantity amounts

- CURRENCY amounts (and also prices) are passed as values with the data type CURRENCY. On a Win32-based platform this is a 64 bit signed long value that implicitly assumes four digits as the fractional part. So, the range supported is from
-922,337,203,685,477.5808
to
+922,337,203,685,477.5807

The fractional part used in the calculation unit of a Fiscal Printer may differ from the CURRENCY data type. The number of digits in the fractional part is stored in the **AmountDecimalPlaces** property and determined by the Fiscal Printer. The application has to take care that calculations in the application use the same fractional part for amounts.

- If the **CapHasVatTable** property is TRUE, VAT rates are passed using the indexes that were sent to the **SetVatValue** method.
If the **CapHasVatTable** property is FALSE, VAT rates are passed as amounts with the data type LONG. The number of digits in the fractional part is implicitly assumed to be four.
- Percentage amounts are used in methods which allow also surcharge and/or discount amounts. If the amounts are specified to be a percentage value the value is also passed in a parameter of type CURRENCY.
On a Win32-based platform the percentage value has then (as given by the CURRENCY data type) four digits in the fractional part.
It is the percentage (0.0001% to 99.9999%) multiplied by 10000.
- Quantity amounts are passed as values with the data type LONG. The number of digits in the fractional part is stored in the **QuantityDecimalPlaces** property and determined by the Fiscal Printer.

Currency Change

If CapSetCurrency is TRUE the Fiscal Printer is able to change the currency, the application may set a new currency (e.g. EURO) using the **SetCurrency** method.

Properties

ActualCurrency Property

Added in Release 1.6

Syntax **LONG ActualCurrency;**

Remarks Holds a value identifying which actual currency is used by the Fiscal Printer.

This property is only valid only if **CapSetCurrency** is TRUE.

Values are:

Value	Meaning
FPTR_AC_BRC	The actual currency is Brazilian cruzeiro.
FPTR_AC_BGL	The actual currency is Bulgarian lev.
FPTR_AC_EUR	The actual currency is EURO.
FPTR_AC_GRD	The actual currency is Greek drachma.
FPTR_AC_HUF	The actual currency is Hungarian forint.
FPTR_AC_ITL	The actual currency is Italian lira.
FPTR_AC_PLZ	The actual currency is Polish zloty.
FPTR_AC_ROL	The actual currency is Romanian leu.
FPTR_AC_RUR	The actual currency is Russian rouble.
FPTR_AC_TRL	The actual currency is Turkish lira.

This property is initialized and kept current while the device is enabled.

See Also **SetCurrency** Method, **CapSetCurrency** Property

AdditionalHeader Property R/W***Added in Release 1.6*****Syntax** **BSTR AdditionalHeader;****Remarks** Specifies a user specific text which will be printed on the receipt after the fixed header lines when calling the **BeginFiscalReceipt** method.

This property is only valid if **CapAdditionalHeader** is TRUE.

This property is initialized to an empty string and kept current while the device is enabled.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	The Fiscal Printer does not support printing text after the fixed header lines
<i>Other Values</i>	See ResultCode .

See Also **BeginFiscalReceipt** Method, **CapAdditionalHeader** Property

AdditionalTrailer Property R/W***Added in Release 1.6*****Syntax** **BSTR AdditionalTrailer;****Remarks** Specifies a user specific text which will be printed on the receipt after the fiscal trailer lines when calling the **EndFiscalReceipt** method.

This property is only valid if **CapAdditionalTrailer** is TRUE.

This property is initialized to an empty string and kept current while the device is enabled.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	The Fiscal Printer does not support printing text after the fiscal trailer lines.
<i>Other Values</i>	See ResultCode .

See Also **EndFiscalReceipt** Method, **CapAdditionalTrailer** Property**AmountDecimalPlaces Property****Syntax** **LONG AmountDecimalPlaces;****Remarks** Holds the number of decimal digits that the fiscal device uses for calculations.

This property is initialized when the device is enabled.

AsyncMode Property R/W

Syntax **BOOL AsyncMode;**

Remarks If TRUE, then some print methods like **PrintRecItemAdjustment**, **PrintRecItem**, **PrintNormal**, etc. will be performed asynchronously.
If FALSE, they will be performed synchronously.

This property is initialized to FALSE by the **Open** method.

For the complete list of method which are performed either synchronously or asynchronously see Fiscal Printer States Model on page **206**.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.

See Also Fiscal Printer States Model (Page **206**)

CapAdditionalHeader Property***Added in Release 1.6***

Syntax **BOOL CapAdditionalHeader;**

Remarks If TRUE, then the Fiscal Printer is able to print application specific text defined in the **AdditionalHeader** property after printing the fixed header lines; otherwise it is FALSE.

This property is initialized by the **Open** method.

CapAdditionalLines Property

Syntax **BOOL CapAdditionalLines;**

Remarks If TRUE, then the Fiscal Printer supports the printing of application defined lines on a fiscal receipt between the total line and the end of the fiscal receipt; otherwise it is FALSE.

If this property is TRUE, then after all totals lines are printed it is possible to print application-defined strings, such as the ones used for fidelity cards. In this case, after the total lines are printed, the **PrinterState** property is set to **ReceiptEnding** and **PrintRecMessage** can be called.

This property is initialized by the **Open** method.

CapAdditionalTrailer Property

Added in Release 1.6

Syntax **BOOL CapAdditionalTrailer;**

Remarks If TRUE, then the Fiscal Printer is able to print application specific text defined in the **AdditionalTrailer** property after printing the fiscal trailer lines; otherwise it is FALSE.

This property is initialized by the **Open** method.

CapAmountAdjustment Property

Syntax **BOOL CapAmountAdjustment;**

Remarks If TRUE, then the Fiscal Printer handles fixed amount discounts or fixed amount surcharges on items; otherwise it is FALSE.

This property is initialized by the **Open** method.

CapAmountNotPaid Property

Syntax	BOOL CapAmountNotPaid;
Remarks	If TRUE, then the Fiscal Printer allows the recording of not paid amounts; otherwise it is FALSE. This property is initialized by the Open method.

CapChangeDue Property

Added in Release 1.6

Syntax	BOOL CapChangeDue;
Remarks	If TRUE, the text to be printed as the cash return description when using PrintRecTotal method can be defined in the ChangeDue property; otherwise it is FALSE. This property is initialized by the Open method.

CapCheckTotal Property

Syntax	BOOL CapCheckTotal;
Remarks	If TRUE, then automatic comparison of the Fiscal Printer's total and the application's total can be enabled and disabled. If FALSE, then the automatic comparison cannot be enabled and is always considered disabled. This property is initialized by the Open method.

CapCoverSensor Property

Syntax	BOOL CapCoverSensor;
Remarks	If TRUE, then the Fiscal Printer has a "cover open" sensor; otherwise it is FALSE. This property is initialized by the Open method.

CapDoubleWidth Property

Syntax	BOOL CapDoubleWidth;
Remarks	If TRUE, then the Fiscal Printer can print double width characters; otherwise it is FALSE. This property is initialized by the Open method.

CapDuplicateReceipt Property

Syntax	BOOL CapDuplicateReceipt;
Remarks	If TRUE, then the Fiscal Printer allows printing more than one copy of the same fiscal receipt; otherwise it is FALSE.. This property is initialized by the Open method.

CapEmptyReceiptIsVoidable Property

Added in Release 1.6

Syntax	BOOL CapEmptyReceiptIsVoidable;
Remarks	If TRUE, then it is allowed to void an opened receipt without any items; otherwise it is FALSE. This property is initialized by the Open method.

CapFiscalReceiptStation Property

Added in Release 1.6

Syntax	BOOL CapFiscalReceiptStation;
Remarks	If TRUE, then the Fiscal Printer supports printing transactions on the station defined by the FiscalReceiptStation property; otherwise it is FALSE. This property is initialized by the Open method.

CapFiscalReceiptType Property***Added in Release 1.6***

- Syntax** **BOOL CapFiscalReceiptType;**
- Remarks** If TRUE, then the Fiscal Printer supports printing different types of fiscal receipts defined by the **FiscalReceiptType** property; otherwise it is FALSE.
- This property is initialized by the **Open** method.

CapFixedOutput Property

- Syntax** **BOOL CapFixedOutput;**
- Remarks** If TRUE, then the Fiscal Printer supports fixed format text printing through the **BeginFixedOutput**, **PrintFixedOutput** and **EndFixedOutput** methods; otherwise it is FALSE.
- This property is initialized by the **Open** method.

CapHasVatTable Property

- Syntax** **BOOL CapHasVatTable;**
- Remarks** If TRUE, then the Fiscal Printer has a tax table; otherwise it is FALSE.
- This property is initialized by the **Open** method.

CapIndependentHeader Property

- Syntax** **BOOL CapIndependentHeader;**
- Remarks** If TRUE, then the Fiscal Printer supports printing the fiscal receipt header lines before the first fiscal receipt command is processed; otherwise it is FALSE.
- This property is initialized by the **Open** method.

CapItemList Property

Syntax	BOOL CapItemList;
Remarks	If TRUE, then the Fiscal Printer can print a report of items of a specified VAT class; otherwise it is FALSE. This property is initialized by the Open method.

CapJrnEmptySensor Property

Syntax	BOOL CapJrnEmptySensor;
Remarks	If TRUE, then the journal has an out-of-paper sensor; otherwise it is FALSE. This property is initialized by the Open method.

CapJrnNearEndSensor Property

Syntax	BOOL CapJrnNearEndSensor;
Remarks	If TRUE, then the journal has a low paper sensor; otherwise it is FALSE. This property is initialized by the Open method.

CapJrnPresent Property

Syntax	BOOL CapJrnPresent;
Remarks	If TRUE, then the journal print station is present; otherwise it is FALSE. Unlike POS printers, on Fiscal Printers the application is not able to directly access the journal. The Fiscal Printer itself prints on the journal if present. This property is initialized by the Open method.

CapMultiContractor Property***Added in Release 1.6***

- Syntax** **BOOL CapMultiContractor;**
- Remarks** If TRUE, then the Fiscal Printer supports more than one contractor assigned to the fiscal receipt items; otherwise it is FALSE.
- This property is initialized by the **Open** method.

CapNonFiscalMode Property

- Syntax** **BOOL CapNonFiscalMode;**
- Remarks** If TRUE, then the Fiscal Printer allows printing in non-fiscal mode; otherwise it is FALSE.
- This property is initialized by the **Open** method.

CapOnlyVoidLastItem Property***Added in Release 1.6***

- Syntax** **BOOL CapOnlyVoidLastItem;**
- Remarks** If TRUE, then only the last printed item can be voided; otherwise it is FALSE.
- This property is initialized by the **Open** method.

CapOrderAdjustmentFirst Property

- Syntax** **BOOL CapOrderAdjustmentFirst;**
- Remarks** This property defines the usage of **PrintRecItem** and **PrintRecItemAdjustment**
- If FALSE, the application has to call **PrintRecItem** first and then call **PrintRecItemAdjustment** to give a discount or a surcharge for a single article.
- If TRUE, the application has to call **PrintRecItemAdjustment** first and then call **PrintRecItem** .
- This property is initialized by the **Open** method.

CapPackageAdjustment Property***Added in Release 1.6***

- Syntax** **BOOL CapPackageAdjustment;**
- Remarks** If TRUE, an adjustment may be given to a package of booked items; otherwise it is FALSE.
- This property is initialized by the **Open** method.

CapPercentAdjustment Property

- Syntax** **BOOL CapPercentAdjustment;**
- Remarks** If TRUE, then the Fiscal Printer handles percentage discounts or percentage surcharges on items; otherwise it is FALSE.
- This property is initialized by the **Open** method.

CapPositiveAdjustment Property***Updated in Release 1.6***

- Syntax** **BOOL CapPositiveAdjustment;**
- Remarks** This property defines abilities of the **PrintRecItemAdjustment** method.
- If TRUE, then it is possible to apply surcharges via the **PrintRecItemAdjustment** method, otherwise it is false.
- This property is initialized by the **Open** method.

CapPostPreLine Property***Added in Release 1.6***

- Syntax** **BOOL CapPostPreLine;**
- Remarks** If TRUE, then the Fiscal Printer supports printing additional lines defined by the **PostLine** and/or **PreLine** properties, when calling some **PrintRec...** methods; otherwise it is FALSE.
- This property is initialized by the **Open** method.

CapPowerLossReport Property

Syntax	BOOL CapPowerLossReport;
Remarks	If TRUE, then the Fiscal Printer can print a power loss report using the PrintPowerLossReport method; otherwise it is FALSE. This property is initialized by the Open method.

CapPredefinedPaymentLines Property

Syntax	BOOL CapPredefinedPaymentLines;
Remarks	If TRUE, the Fiscal Printer can store and print predefined payment descriptions; otherwise it is FALSE. This property is initialized by the Open method.

CapReceiptNotPaid Property

Syntax	BOOL CapReceiptNotPaid;
Remarks	If TRUE, then the Fiscal Printer supports using the PrintRecNotPaid method to specify a part of the receipt total that is not paid; otherwise it is FALSE. This property is initialized by the Open method.

CapRecEmptySensor Property

Syntax	BOOL CapRecEmptySensor;
Remarks	If TRUE, then the receipt has an out-of-paper sensor; otherwise it is FALSE. This property is initialized by the Open method.

CapRecNearEndSensor Property

- Syntax** **BOOL CapRecNearEndSensor;**
- Remarks** If TRUE, then the receipt has a low paper sensor;
otherwise it is FALSE.
- This property is initialized by the **Open** method.

CapRecPresent Property

- Syntax** **BOOL CapRecPresent;**
- Remarks** If TRUE, then the receipt print station is present;
otherwise it is FALSE.
- This property is initialized by the **Open** method.

CapRemainingFiscalMemory Property

- Syntax** **BOOL CapRemainingFiscalMemory;**
- Remarks** If TRUE, then the Fiscal Printer supports using the **RemainingFiscalMemory** property to show the amount of Fiscal Memory remaining. If FALSE, the printer does not support reporting the Fiscal Memory status of the Fiscal Printer.
- This property is initialized by the **Open** method.

CapReservedWord Property

- Syntax** **BOOL CapReservedWord;**
- Remarks** If TRUE, then the Fiscal Printer prints a reserved word (for example, "TOTALE") before printing the total amount; otherwise it is FALSE.
- If TRUE, the reserved word is stored in the **ReservedWord** property. This reserved word may not be printed using any fiscal print method.
- This property is initialized by the **Open** method.

CapSetCurrency Property***Added in Release 1.6***

- Syntax** **BOOL CapSetCurrency;**
- Remarks** If TRUE, then the Fiscal Printer is able to change the currency to a new one by calling **SetCurrency** method; otherwise it is FALSE.
- This property is initialized by the **Open** method.

CapSetHeader Property

- Syntax** **BOOL CapSetHeader;**
- Remarks** If TRUE, then it is possible to use the **SetHeaderLine** method to initialize the contents of a particular line of the receipt header; otherwise it is FALSE.
- This property is initialized by the **Open** method.

CapSetPOSID Property

- Syntax** **BOOL CapSetPOSID;**
- Remarks** If TRUE, then it is possible to use the **SetPOSID** method to initialize the values of POSID and CashierID; otherwise it is FALSE.
- These values are printed on each fiscal receipt.
- This property is initialized by the **Open** method.

CapSetStoreFiscalID Property

- Syntax** **BOOL CapSetStoreFiscalID;**
- Remarks** If TRUE, then it is possible to use the **SetStoreFiscalID** method to set up the Fiscal ID number which will be printed on each fiscal receipt; otherwise it is FALSE.
- This property is initialized by the **Open** method.

CapSetTrailer Property

- Syntax** **BOOL CapSetTrailer;**
- Remarks** If TRUE, then it is possible to use the **SetTrailerLine** method to initialize the contents of a particular line of the receipt trailer; otherwise it is FALSE.
- This property is initialized by the **Open** method.

CapSetVatTable Property

- Syntax** **BOOL CapSetVatTable;**
- Remarks** If TRUE, then it is possible to use the **SetVatValue** and **SetVatTable** methods to modify the contents of the Fiscal Printer's VAT table; otherwise it is FALSE.
- Some Fiscal Printers may not allow existing VAT table entries to be modified. Only new entries may be set on these Fiscal Printers.
- This property is initialized by the **Open** method.

CapSlpEmptySensor Property

- Syntax** **BOOL CapSlpEmptySensor;**
- Remarks** If TRUE, then the slip has a "slip in" sensor; otherwise it is FALSE.
- This property is initialized by the **Open** method.

CapSlpFiscalDocument Property

- Syntax** **BOOL CapSlpFiscalDocument;**
- Remarks** If TRUE, then the Fiscal Printer allows fiscal printing to the slip station; otherwise it is FALSE.
- This property is initialized by the **Open** method.

CapSlpFullSlip Property

Syntax **BOOL CapSlpFullSlip;**

Remarks If TRUE, then the Fiscal Printer supports printing full length forms on the slip station; otherwise it is FALSE.

It is possible to choose between full slip and validation documents by setting the **SlipSelection** property.

This property is initialized by the **Open** method.

CapSlpNearEndSensor Property

Syntax **BOOL CapSlpNearEndSensor;**

Remarks If TRUE, then the slip has a “slip near end” sensor; otherwise it is FALSE.

This property is initialized by the **Open** method.

CapSlpPresent Property

Syntax **BOOL CapSlpPresent;**

Remarks If TRUE, then the Fiscal Printer has a slip station; otherwise it is FALSE.

This property is initialized by the **Open** method.

CapSlpValidation Property

Syntax	BOOL CapSlpValidation;
Remarks	<p>If TRUE, then the Fiscal Printer supports printing validation information on the slip station; otherwise it is FALSE.</p> <p>It is possible to choose between full slip and validation documents by setting the SlipSelection property.</p> <p>In some countries, when printing non fiscal validations using the slip station a limited number of lines could be printed.</p> <p>This property is initialized by the Open method.</p>

CapSubAmountAdjustment Property

Syntax	BOOL CapSubAmountAdjustment;
Remarks	<p>If TRUE, then the Fiscal Printer handles fixed amount discounts on the subtotal; otherwise it is FALSE.</p> <p>This property is initialized by the Open method.</p>

CapSubPercentAdjustment Property

Syntax	BOOL CapSubPercentAdjustment;
Remarks	<p>If TRUE, then the Fiscal Printer handles percentage discounts on the subtotal; otherwise it is FALSE.</p> <p>This property is initialized by the Open method.</p>

CapSubtotal Property

Syntax	BOOL CapSubtotal;
Remarks	If TRUE, then it is possible to use the PrintRecSubtotal method to print the current subtotal; otherwise it is FALSE. This property is initialized by the Open method.

CapTotalizerType Property

Added in Release 1.6

Syntax	BOOL CapTotalizerType;
Remarks	If TRUE, then the Fiscal Printer supports reading different types of totalizers by calling the GetTotalizer method; otherwise it is FALSE. This property is initialized by the Open method.

CapTrainingMode Property

Syntax	BOOL CapTrainingMode;
Remarks	If TRUE, then the Fiscal Printer supports a training mode; otherwise it is FALSE. This property is initialized by the Open method.

CapValidateJournal Property

Syntax	BOOL CapValidateJournal;
Remarks	If TRUE, then it is possible to use the PrintNormal method to print a validation string on the journal station; otherwise it is FALSE. This property is initialized by the Open method.

CapXReport Property

Syntax	BOOL CapXReport;
Remarks	If TRUE, then it is possible to use the PrintXReport method to print an X report; otherwise it is FALSE. This property is initialized by the Open method.

ChangeDue Property R/W

Added in Release 1.6

Syntax	BSTR ChangeDue;
Remarks	This property holds the text to be printed as a description for the cash return when using the PrintRecTotal method.

This property is only valid if **CapChangeDue** is TRUE.

This property is initialized to an empty string by the **Open** method.

Return	When this property is set, one of the following values is placed in the ResultCode property:
---------------	---

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	Setting this property is not valid for this service object (see CapChangeDue).
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_BAD_LENGTH:	The length of the string to be printed is too long.
<i>Other Values</i>	See ResultCode .

See Also	PrintRecTotal Method, CapChangeDue Property
-----------------	---

CheckTotal Property R/W

Syntax **BOOL CheckTotal;**

Remarks If TRUE, automatic comparison between the Fiscal Printer's total and the application's total is enabled. If FALSE, automatic comparison is disabled.

This property is only valid if **CapCheckTotal** is TRUE.

This property is initialized to TRUE by the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	Setting this property is not valid for this service object (see CapCheckTotal).

ContractorId Property R/W***Added in Release 1.6*****Syntax** **LONG ContractorId;**

Remarks The identification of the contractor to whom the receipt and/or some items of the receipt are assigned.
It is used to define different header lines to be printed on the fiscal receipt, in order to assign any item to a specific contractor and to modify the counters and totalizers to be read using **GetData** and **GetTotalizer** methods.

Values are:

Value	Meaning
FPTR_CID_FIRST	First contractor is defined.
FPTR_CID_SECOND	Second contractor is defined.
FPTR_CID_SINGLE	Single contractor.

This property is initialized to FPTR_CID_SINGLE and kept current while the device is enabled, which is the functionality supported prior to Release 1.6.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	Setting this property is not valid for this service object (see CapMultiContractor).
<i>Other Values</i>	See ResultCode .

See Also **BeginFiscalReceipt** Method, **GetData** Method, **GetTotalizer** Method, **PrintRec...** Methods, **CapMultiContractor** Property

CountryCode Property***Updated in Release 1.6*****Syntax** **LONG CountryCode;****Remarks** Holds a value identifying which countries are supported by this Service Object. It can contain any of the following values logically ORed together:

Value	Meaning
FPTR_CC_BRAZIL	The Fiscal Printer supports Brazil's fiscal rules.
FPTR_CC_GREECE	The Fiscal Printer supports Greece's fiscal rules.
FPTR_CC_HUNGARY	The Fiscal Printer supports Hungary's fiscal rules.
FPTR_CC_ITALY	The Fiscal Printer supports Italy's fiscal rules.
FPTR_CC_POLAND	The Fiscal Printer supports Poland's fiscal rules.
FPTR_CC_RUSSIA	The Fiscal Printer supports Russia's fiscal rules.
FPTR_CC_TURKEY	The Fiscal Printer supports Turkey's fiscal rules.
FPTR_CC_BULGARIA	The Fiscal Printer supports Bulgaria's fiscal rules.
FPTR_CC_ROMANIA	The Fiscal Printer supports Romania's fiscal rules.

This property is initialized when the device is first initialized following the **Open** method. (In releases prior to 1.5, this description stated that initialization took place by the **Open** method. In Release 1.5, it was updated for consistency with other devices.)

CoverOpen Property**Syntax** **BOOL CoverOpen;****Remarks** If TRUE, then the Fiscal Printer's cover is open; otherwise it is FALSE.

If the **CapCoverSensor** property is FALSE, then the Fiscal Printer does not have a cover open sensor, and this property always returns FALSE.

This property is initialized and kept current while the device is enabled.

DateType Property R/W***Added in Release 1.6*****Syntax** **LONG DateType;**

Remarks Specifies the type of date to be requested when calling the **GetDate** method.

Values are:

Value	Meaning
FPTR_DT_CONF	Date of configuration.
FPTR_DT_EOD	Date of last end of day.
FPTR_DT_RESET	Date of last reset.
FPTR_DT_RTC	Real time clock of the Fiscal Printer.
FPTR_DT_VAT	Date of last VAT change.

This property is initialized to FPTR_DT_RTC and kept current while the device is enabled, which is the functionality supported prior to Release 1.6.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	The Fiscal Printer does not support the specified type.
<i>Other Values</i>	See ResultCode .

See Also **GetDate** Method

DayOpened Property***Updated in Release 1.6*****Syntax** **BOOL DayOpened;**

Remarks If TRUE, then the fiscal day has been started on the Fiscal Printer by a first call to the **BeginFiscalReceipt** or **BeginFiscalDocument** method at a fiscal period (day); otherwise it is FALSE.

The Fiscal Day of the Fiscal Printer can be either opened or not opened. The **DayOpened** property reflects whether or not the Fiscal Printer considers its Fiscal Day to be opened or not.

Some methods may only be called while the Fiscal Day is not yet opened (**DayOpened** is FALSE). Methods that can be called after the Fiscal Day is opened change from country to country. Usually all the configuration methods are to be called only before the Fiscal Day is opened.

This property changes to FALSE after calling the **PrintZReport** method.

Depending on fiscal legislation, some of the following methods may be allowed only if the printer has not yet begun its Fiscal Day:

- SetCurrency**
- SetDate**
- SetHeaderLine**
- SetPOSID**
- SetStoreFiscalID**
- SetTrailerLine**
- SetVatTable**
- SetVatValue**

This property is initialized and kept current while the device is enabled.

DescriptionLength Property

Updated in Release 1.6

Syntax **LONG DescriptionLength;**

Remarks Holds the maximum number of characters that may be passed as a description parameter.

The exact maximum number for a description parameter of a specific method can be obtained by calling **GetData** method

This property is initialized by the **Open** method.

See Also **GetData** Method

DuplicateReceipt Property R/W

Syntax **BOOL DuplicateReceipt;**

Remarks If this property is set to TRUE all the printing commands inside a fiscal receipt will be buffered and they can be printed again via the **PrintDuplicateReceipt** method.

This property is only valid if **CapDuplicateReceipt** is TRUE.

This property is initialized to FALSE by the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	Setting this property is not valid for this service object (see CapDuplicateReceipt).

ErrorLevel Property

Syntax **LONG ErrorLevel;**

Remarks The severity of the error condition.

Values are:

Value	Meaning
FPTR_EL_NONE	No error condition is present.
FPTR_EL_RECOVERABLE	A recoverable error has occurred. (Example: Out of paper.)
FPTR_EL_FATAL	A non-recoverable error has occurred. (Example: Internal printer failure.)
FPTR_EL_BLOCKED	A severe hardware failure which can be resolved only by authorized technicians. (Example: Fiscal memory failure.). This error can not be recovered.

This property is set by the Control just before delivering an **ErrorEvent**. When the error is cleared, then the property is changed to FPTR_EL_NONE.

ErrorOutID Property

Syntax **LONG ErrorOutID;**

Remarks The identifier of the output in the queue which raised an error event, when using asynchronous printing.

This property is set just before an **ErrorEvent** is delivered.

This property is initialized when the device is first enabled following the **Open** method. (In releases prior to 1.5, this description stated that initialization took place by the **Open** method. In Release 1.5, it was updated for consistency with other devices.)

ErrorState Property

Syntax	LONG ErrorState;
Remarks	<p>Holds the current state of the Fiscal Printer when an ErrorEvent is delivered for an asynchronous output.</p> <p>This property is set just before an ErrorEvent is delivered.</p> <p>See the PrinterState property on page 259 for a list of values.</p>

ErrorStation Property

Syntax	LONG ErrorStation;
Remarks	<p>Holds the station or stations that were printing when an error was detected.</p> <p>This property will be set to one of the following values: FPTR_S_JOURNAL, FPTR_S_RECEIPT, FPTR_S_SLIP, FPTR_S_JOURNAL_RECEIPT.</p> <p>This property is only valid if the ErrorLevel is not equal to FPTR_EL_NONE.</p> <p>This property is set just before an ErrorEvent is delivered.</p>

ErrorString Property

Syntax	BSTR ErrorString;
Remarks	<p>A vendor-supplied description of the current error.</p> <p>This property is set by the Control just before delivering an ErrorEvent. If no description is available, the property is set to an empty string. When the error is cleared, then the property is changed to an empty string.</p>

FiscalReceiptStation Property R/W***Added in Release 1.6*****Syntax** **LONG FiscalReceiptStation;**

Remarks Selects the stations where the transaction of the fiscal receipt started with **BeginFiscalReceipt** method will be printed. Setting this property is only allowed in the Monitor State.

The values of *Station* are:

Value	Meaning
FPTR_RS_RECEIPT	The following transactions will be printed on the receipt station.
FPTR_RS_SLIP	The following transactions will be printed on the slip station.

This property is only valid if **CapFiscalReceiptStation** is TRUE.

This property is initialized to FPTR_RS_RECEIPT and kept current while the device is enabled, which is the functionality supported prior to Release 1.6.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	The Fiscal Printer does not support the specified station.
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer is not currently in the Monitor State.
<i>Other Values</i>	See ResultCode .

See Also **BeginFiscalReceipt** Method, **CapFiscalReceiptStation** Property

FiscalReceiptType Property R/W***Added in Release 1.6*****Syntax** **LONG FiscalReceiptType;****Remarks** Selects the type of the fiscal receipt. Setting this property is only allowed in the Monitor State.

Values are:

Value	Meaning
FPTR_RT_CASH_IN	Cash-in receipt
FPTR_RT_CASH_OUT	Cash-out receipt
FPTR_RT_GENERIC	Generic receipt
FPTR_RT_SALES	Retail sales receipt
FPTR_RT_SERVICE	Service sales receipt
FPTR_RT_SIMPLE_INVOICE	Simplified invoice receipt

This property is only valid if **CapFiscalReceiptType** is TRUE.

This property is initialized to FPTR_RT_SALES and kept current while the device is enabled, which is the functionality supported prior to Release 1.6.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	The Fiscal Printer does not support the specified receipt type.
OPOS_E_EXTENDED:	

ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:
The Fiscal Printer is not currently in the Monitor State.*Other Values* See **ResultCode**.**See Also** **BeginFiscalReceipt Method, CapFiscalReceiptType Property**

FlagWhenIdle Property R/W

Syntax **BOOL FlagWhenIdle;**

Remarks If TRUE, the Control will fire a **StatusUpdateEvent** if it is in the idle state.
If FALSE, this event will not be fired.

FlagWhenIdle is automatically reset to FALSE when the status event is delivered.

The main use of idle status event that is controlled by this property is to give the application control when all outstanding asynchronous outputs have been processed. The event will be fired if the outputs were completed successfully or if they were cleared by the **ClearOutput** method or by an **ErrorEvent** handler.

If the **State** is already set to OPOS_S_IDLE when the **FlagWhenIdle** property is set to TRUE, then a **StatusUpdateEvent** is fired immediately. The application can therefore depend upon the event, with no race condition between the starting of its last asynchronous output and the setting of this flag.

This property is initialized to FALSE by the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.

JrnEmpty Property

Syntax **BOOL JrnEmpty;**

Remarks If TRUE, the journal is out of paper.
If FALSE, journal paper is present.

If **CapJrnEmptySensor** is FALSE, then the value of this property is always FALSE.

This property is initialized and kept current while the device is enabled.

See Also **JrnNearEnd** Property

JrnNearEnd Property

Syntax	BOOL JrnNearEnd;
Remarks	<p>If TRUE, the journal paper is low. If FALSE, journal paper is not low.</p> <p>If CapJrnNearEndSensor is FALSE, then the value of this property is always FALSE.</p> <p>This property is initialized and kept current while the device is enabled.</p>
See Also	JrnEmpty Property

MessageLength Property

Syntax	LONG MessageLength;
Remarks	<p>Holds the maximum number of characters that may be passed as a message line in the method PrintRecMessage. The value may change in different modes of the Fiscal Printer. For example in the mode “Fiscal Receipt” the number of characters may be bigger than in the mode “Fiscal Receipt Total”.</p> <p>This property is initialized by the Open method.</p>

MessageType Property R/W***Added in Release 1.6*****Syntax** **LONG MessageType;**

Remarks Selects the kind of message to be printed when using the **PrintRecMessage** method.
Values are:

Value

FPTR_MT_ADVANCE

FPTR_MT_ADVANCE_PAID

FPTR_MT_AMOUNT_TO_BE_PAID

FPTR_MT_AMOUNT_TO_BE_PAID_BACK

FPTR_MT_CARD

FPTR_MT_CARD_NUMBER

FPTR_MT_CARD_TYPE

FPTR_MT_CASH

FPTR_MT_CASHIER

FPTR_MT_CASH_REGISTER_NUMBER

FPTR_MT_CHANGE

FPTR_MT_CHEQUE

FPTR_MT_CLIENT_NUMBER

FPTR_MT_CLIENT_SIGNATURE

FPTR_MT_COUNTER_STATE

FPTR_MT_CREDIT_CARD

FPTR_MT_CURRENCY

FPTR_MT_CURRENCY_VALUE

FPTR_MT_DEPOSIT

FPTR_MT_DEPOSIT_RETURNED

FPTR_MT_DOT_LINE

FPTR_MT_DRIVER_NUMB

FPTR_MT_EMPTY_LINE
FPTR_MT_FREE_TEXT
FPTR_MT_FREE_TEXT_WITH_DAY_LIMIT
FPTR_MT_GIVEN_DISCOUNT
FPTR_MT_LOCAL_CREDIT
FPTR_MT_MILEAGE_KM
FPTR_MT_NOTE
FPTR_MT_PAID
FPTR_MT_PAY_IN
FPTR_MT_POINT_GRANTED
FPTR_MT_POINTS_BONUS
FPTR_MT_POINTS_RECEIPT
FPTR_MT_POINTS_TOTAL
FPTR_MT_PROFITED
FPTR_MT_RATE
FPTR_MT_REGISTER_NUMB
FPTR_MT_SHIFT_NUMBER
FPTR_MT_STATE_OF_AN_ACCOUNT
FPTR_MT_SUBSCRIPTION
FPTR_MT_TABLE
FPTR_MT_THANK_YOU_FOR_LOYALTY
FPTR_MT_TRANSACTION_NUMB
FPTR_MT_VALID_TO
FPTR_MT_VOUCHER
FPTR_MT_VOUCHER_PAID
FPTR_MT_VOUCHER_VALUE
FPTR_MT_WITH_DISCOUNT

FPTR_MT_WITHOUT_UPLIFT

This property is initialized to **FPTR_MT_FREE_TEXT** by the **Open** method, which is the functionality supported prior to Release 1.6.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	The Fiscal Printer does not support this value.
<i>Other Values</i>	See ResultCode .

See Also **PrintRecMessage** Method

NumHeaderLines Property

Syntax **LONG NumHeaderLines;**

Remarks Contains the maximum number of header lines that can be printed for each fiscal receipt. Header lines usually contain information like store address, store name, store Fiscal ID. Each header line is set using the **SetHeaderLine** method and remains set even after the Fiscal Printer is switched off. Header lines are automatically printed when a fiscal receipt is initiated using the **BeginFiscalReceipt** method or when the first line item inside a receipt is sold.

This property is initialized by the **Open** method.

NumTrailerLines Property

Syntax **LONG NumTrailerLines;**

Remarks Contains the maximum number of trailer lines that can be printed for each fiscal receipt. Trailer lines are usually promotional messages. Each trailer line is set using the **SetTrailerLine** method and remains set even after the Fiscal Printer is switched off. Trailer lines are automatically printed either after the last **PrintRecTotal** or when a fiscal receipt is closed using the **EndFiscalReceipt** method.

This property is initialized by the **Open** method.

NumVatRates Property

Syntax **LONG NumVatRates;**

Remarks Contains the maximum number of vat rates that can be entered into the Fiscal Printer's Vat table.

This property is initialized by the **Open** method.

PostLine Property R/W***Added in Release 1.6*****Syntax** **BSTR PostLine;**

Remarks An application specific text to be printed on the receipt after a line item invoked by some **PrintRec...** methods. The property can be written in the Fiscal Receipt State. The length of the text is reduced to a country specific value.

This property is only valid if **CapPostPreLine** is TRUE .

This property is initialized to an empty string and will be reset to an empty string after being used.

Return When this property is set, one of the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	The Fiscal Printer does not support printing post item lines or the text contains invalid characters
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_BAD_LENGTH:	The length of string is too long.
<i>Other Values</i>	See ResultCode .

See Also **PrintRecSubtotal** Method, **PrintRecTotal** Method, **CapPostPreLine** Property

PredefinedPaymentLines Property

Syntax **BSTR PredefinedPaymentLines;**

Remarks The value of this property is the list of all possible words to be used as indexes of the predefined payment lines (for example, “a,b,c,d,z”). Those indexes are used in the **PrintRecTotal** method for the *description* parameter.

If **CapPredefinedPaymentLines** is TRUE, only predefined payment lines are allowed.

This property is initialized by the **Open** method.

PreLine Property R/W***Added in Release 1.6*****Syntax** **BSTR PreLine;**

Remarks An application specific text to be printed on the receipt before a line item invoked by some **PrintRec...** methods. The property can be written in the Fiscal Receipt State. The length of the text is reduced to a country specific value.

This property is only valid if **CapPostPreLine** is TRUE.

This property is initialized to an empty string and will be reset to an empty string after being used.

Return When this property is set, one of the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	The Fiscal Printer does not support printing pre item lines or the text contains invalid characters
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_BAD_LENGTH:	The length of string is too long.
<i>Other Values</i>	See ResultCode .

See Also **PrintRecItem** Method, **PrintRecItemAdjustment** Method, **PrintRecRefund** Method, **PrintRecSubtotalAdjustment** Method, **CapPostPreLine** Property

PrinterState Property**Syntax** **LONG PrinterState;****Remarks** Holds the Fiscal Printer's current operational state. This property controls which methods are currently legal.

Values are:

Value	Meaning
FPTR_PS_MONITOR	<p>If TrainingModeActive property is FALSE: The Fiscal Printer is currently not in a specific operational mode. In this state the Fiscal Printer will accept any of the Begin... methods as well as the Set... methods.</p> <p>If TrainingModeActive property is TRUE: The Fiscal Printer is currently being used for training purposes. In this state the Fiscal Printer will accept any of the PrintRec... methods or the EndTraining method.</p>
FPTR_PS_FISCAL_RECEIPT	<p>If TrainingModeActive property is FALSE: The Fiscal Printer is currently processing a fiscal receipt. In this state the Fiscal Printer will accept any of the PrintRec... methods.</p> <p>If TrainingModeActive property is TRUE: The Fiscal Printer is currently being used for training purposes and a fiscal receipt is currently opened.</p>
FPTR_PS_FISCAL_RECEIPT_TOTAL	<p>If TrainingModeActive property is FALSE: The Fiscal Printer has already accepted at least one payment, but the total has not been completely paid. In this state the Fiscal Printer will accept either the PrintRecTotal or PrintRecNotPaid methods.</p> <p>If TrainingModeActive property is TRUE: The Fiscal Printer is currently being used for training purposes and the Fiscal Printer has already accepted at least one payment, but the total has not been completely paid.</p>
FPTR_PS_FISCAL_RECEIPT_ENDING	<p>If TrainingModeActive property is FALSE: The Fiscal Printer has completed the receipt up to the total line. In this state the Fiscal Printer will accept either the PrintRecMessage or EndFiscalReceipt methods.</p>

If **TrainingModeActive** property is TRUE:
The Fiscal Printer is currently being used for training purposes and a fiscal receipt is going to be closed.

FPTR_PS_FISCAL_DOCUMENT

The Fiscal Printer is currently processing a fiscal slip. In this state the Fiscal Printer will accept either the **PrintFiscalDocumentLine** or **EndFiscalDocument** methods.

FPTR_PS_FIXED_OUTPUT

The Fiscal Printer is currently processing fixed text output to one or more stations. In this state the Fiscal Printer will accept either the **PrintFixedOutput** or **EndFixedOutput** methods.

FPTR_PS_ITEM_LIST The Fiscal Printer is currently processing an item list report. In this state the Fiscal Printer will accept either the **VerifyItem** or **EndItemList** methods.

FPTR_PS_NONFISCAL The Fiscal Printer is currently processing non-fiscal output to one or more stations. In this state the Fiscal Printer will accept either the **PrintNormal** or **EndNonFiscal** methods.

FPTR_PS_LOCKED The Fiscal Printer has encountered a non-recoverable hardware problem. An authorized Fiscal Printer technician must be contacted to exit this state.

FPTR_PS_REPORT The Fiscal Printer is currently processing a fiscal report. In this state the Fiscal Printer will not accept any methods until the report has completed.

There are a few methods that are accepted in any state except **FPTR_PS_LOCKED**. These are **BeginInsertion**, **EndInsertion**, **BeginRemoval**, **EndRemoval**, **GetDate**, **GetData**, **GetTotalizer**, **GetVatEntry**, **ResetPrinter** and **ClearOutput**.

For more information, see the discussion of Printer States on page 210.

This property is initialized when the device is first enabled following the **Open** method. (In releases prior to 1.5, this description stated that initialization took place by the **Open** method. In Release 1.5, it was updated for consistency with other devices.)

QuantityDecimalPlaces Property

- Syntax** **LONG QuantityDecimalPlaces;**
- Remarks** Holds the number of decimal digits in the fractional part that should be assumed to be in any quantity parameter passed to this Service Object.
- This property is initialized when the device is first enabled following the **Open** method. (In releases prior to 1.5, this description stated that initialization took place by the **Open** method. In Release 1.5, it was updated for consistency with other devices.)

QuantityLength Property

- Syntax** **LONG QuantityLength;**
- Remarks** Holds the maximum number of digits that may be passed as a quantity parameter, including both the whole and fractional parts.
- This property is initialized when the device is first enabled following the **Open** method. (In releases prior to 1.5, this description stated that initialization took place by the **Open** method. In Release 1.5, it was updated for consistency with other devices.)

RecEmpty Property

- Syntax** **BOOL RecEmpty;**
- Remarks** If TRUE, the receipt is out of paper.
If FALSE, receipt paper is present.
- If **CapRecEmptySensor** is FALSE, then the value of this property is always FALSE.
- This property is initialized and kept current while the device is enabled.
- See Also** **RecNearEnd** Property

RecNearEnd Property

Syntax	BOOL RecNearEnd;
Remarks	<p>If TRUE, the receipt paper is low. If FALSE, receipt paper is not low.</p> <p>If CapRecNearEndSensor is FALSE, then the value of this property is always FALSE.</p> <p>This property is initialized and kept current while the device is enabled.</p>
See Also	RecEmpty Property

RemainingFiscalMemory Property

Syntax	LONG RemainingFiscalMemory;
Remarks	<p>Holds the remaining counter of Fiscal Memory.</p> <p>This property is initialized and kept current while the device is enabled and may be updated by PrintZReport method.</p>
See Also	CapRemainingFiscalMemory Property

ReservedWord Property

Syntax	BSTR ReservedWord;
Remarks	<p>Holds the string that is automatically printed with the total when the PrintRecTotal method is called. This word may not occur in any string that is passed into any fiscal output methods.</p> <p>This property is only valid if CapReservedWord is TRUE.</p> <p>This property is initialized by the Open method.</p>

SlpEmpty Property

Syntax **BOOL SlpEmpty;**

Remarks If TRUE, a slip form is not present.
 If FALSE, a slip form is present.

If **CapSlpEmptySensor** is FALSE, then the value of this property is always FALSE.

This property is initialized and kept current while the device is enabled.

Note

The “slip empty” sensor should be used primarily to determine whether a form has been inserted before printing, and can be monitored to determine whether a form is still in place. This sensor is usually placed one or more print lines above the slip print head.

However, the “slip near end” sensor (when present) should be used to determine when nearing the end of the slip. This sensor is usually placed one or more print lines below the slip print head.

See Also **SlpNearEnd** Property

SlpNearEnd Property

Syntax **BOOL SlpNearEnd;**

Remarks If TRUE, the slip form is near its end.
If FALSE, the slip form is not near its end.

The “near end” sensor is also sometimes called the “trailing edge” sensor, referring to the bottom edge of the slip.

If **CapSlpNearEndSensor** is FALSE, then the value of this property is always FALSE.

This property is initialized and kept current while the device is enabled.

Note

The “slip empty” sensor should be used primarily to determine whether a form has been inserted before printing, and can be monitored to determine whether a form is still in place. This sensor is usually placed one or more print lines above the slip print head.

However, the “slip near end” sensor (when present) should be used to determine when nearing the end of the slip. This sensor is usually placed one or more print lines below the slip print head.

See Also **SlpEmpty** Property

SlipSelection Property R/W**Syntax** **LONG SlipSelection;****Remarks** Selects the kind of document to be printed on the slip station.

Values are:

Value	Meaning
FPTR_SS_FULL_LENGTH	Print full length documents.
FPTR_SS_VALIDATION	Print validation documents.

The value of **SlipSelection** is initialized to FPTR_SS_FULL_LENGTH by the **ClaimDevice** method.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An invalid slip type was specified.

TotalizerType Property R/W***Added in Release 1.6*****Syntax** **LONG TotalizerType;**

Remarks Specifies the type of totalizer to be requested using the **GetTotalizer** method.

Values are:

Value	Meaning
FPTR_TT_DOCUMENT	Document totalizer.
FPTR_TT_DAY	Day totalizer.
FPTR_TT_RECEIPT	Receipt totalizer
FPTR_TT_GRAND	Grand totalizer.

This property is only valid if **CapTotalizerType** is TRUE.

This property is initialized to FPTR_TT_DAY and kept current while the device is enabled, which is the functionality supported prior to Release 1.6.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	The Fiscal Printer does not support defining totalizer types or an invalid type was specified.
<i>Other Values</i>	See ResultCode .

See Also **GetTotalizer** Method, **CapTotalizerType** Property

TrainingModeActive Property

Syntax **BOOL TrainingModeActive;**

Remarks Holds the current Fiscal Printer's operational state concerning the training mode. Training mode allows all fiscal commands, but each receipt is marked as non-fiscal and no internal Fiscal Printer registers are updated with any data while in training mode. Some countries' fiscal rules require that all blank characters on a training mode receipt are printed as some other character. Italy, for example, requires that all training mode receipts print a ? instead of a blank.

Values are:

Value	Meaning
TRUE	The Fiscal Printer is currently in training mode. That means no data are written into the EPROM of the Fiscal Printer.
FALSE	The Fiscal Printer is currently in normal mode. All printed receipts will also update the fiscal memory..

Methods

BeginFiscalDocument Method

Updated in Release 1.6

Syntax **LONG BeginFiscalDocument (LONG DocumentAmount);**

Parameter	Description
<i>DocumentAmount</i>	Amount of document to be stored by the Fiscal Printer.

Remarks Called to initiate fiscal printing to the slip station.

This method is only supported if **CapSlpFiscalDocument** is TRUE.

If this is the first call to the **BeginFiscalDocument** method, the Fiscal Day will be started and the **DayOpened** property will be set to TRUE.

The slip paper must be inserted into the slip station using **Begin/EndInsertion** before calling this method.

Each fiscal line will be printed using the **PrintFiscalDocumentLine** method.

If this method is successful, the **PrinterState** property will be changed to FPTR_PS_FISCAL_DOCUMENT.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none">• The slip station does not exist (see the CapSlpPresent property).• The Fiscal Printer does not support fiscal output to the slip station (see the CapSlpFiscalDocument property).

OPOS_E_EXTENDED:

ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:

The Fiscal Printer's current state does not allow this state transition.

ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:

There is no paper in the slip station.

ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_AMOUNT:

The *DocumentAmount* parameter is invalid.

ResultCodeExtended = OPOS_EFPTR_MISSING_SET_CURRENCY:

The new receipt cannot be opened, cause the Fiscal Printer is expecting the current currency to be changed by calling **SetCurrency** method.

Other Values

See **ResultCode**.

See Also **EndFiscalDocument** Method, **PrintFiscalDocumentLine** Method,
PrintZReport Method, **AmountDecimalPlaces** Property, **DayOpened** Property

BeginFiscalReceipt Method***Updated in Release 1.6*****Syntax** **LONG BeginFiscalReceipt (BOOL *PrintHeader*);**

Parameter	Description
-----------	-------------

<i>PrintHeader</i>	Indicates if the header lines are to be printed at this time.
--------------------	---

Remarks Called to initiate fiscal printing to the receipt station.

If **CapFiscalReceiptStation** is TRUE, the **FiscalReceiptStation** property defines the station where the receipt will be printed. If **CapFiscalReceiptStation** is FALSE, the receipt will be printed on the receipt station.

If **CapFiscalReceiptType** is TRUE, the receipt type must be defined in **FiscalReceiptType** and a header line according to the specified receipt type will be printed.

If this is the first call to the **BeginFiscalReceipt** method, the Fiscal Day will be started and the **DayOpened** property will be set to TRUE.

If *PrintHeader* and the **CapIndependentHeader** property are both TRUE all defined header lines will be printed before control is returned. Otherwise header lines will be printed when the first item is sold in the case they are not printed at the end of the preceding receipt. If **CapAdditionalHeader** is TRUE, application specific header lines defined by the **AdditionalHeader** property will be printed after the fixed header lines.

if **CapMultiContractor** is TRUE, the current receipt is assigned to the contractor specified by the **ContractorId** property.

If this method is successful, the **PrinterState** property will be changed to FPTR_PS_FISCAL_RECEIPT.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer's current state does not allow this state transition.
ResultCodeExtended = OPOS_EFPTR_MISSING_SET_CURRENCY:	The new receipt cannot be opened, cause the Fiscal Printer is expecting the current currency to be changed by calling SetCurrency method.
<i>Other Values</i>	See ResultCode .

See Also **EndFiscalReceipt** Method, **PrintRec...** Methods, **AdditionalHeader** Property, **ContractorId** Property, **DayOpened** Property, **FiscalReceiptStation** Property, **FiscalReceiptType** Property

BeginFixedOutput Method

Syntax **LONG BeginFixedOutput (LONG *Station*, LONG *DocumentType*);**

Parameter	Description
<i>Station</i>	The Fiscal Printer station to be used. May be either FPTR_S_RECEIPT or FPTR_S_SLIP.
<i>DocumentType</i>	Identifier of a document stored in the Fiscal Printer.

Remarks Called to initiate non-fiscal fixed text printing on a Fiscal Printer station. This method is only supported if **CapFixedOutput** is TRUE.

If the *Station* parameter is FPTR_S_SLIP, the slip paper must be inserted into the slip station using **Begin/EndInsertion** before calling this method.

Each fixed output will be printed using the **PrintFixedOutput** method. If this method is successful, the **PrinterState** property will be changed to FPTR_PS_FIXED_OUTPUT. The **EndFixedOutput** method ends fixed output modality and resets **PrinterState**.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> • The slip station does not exist (see the CapSlpPresent property). • The Fiscal Printer does not support fixed output (see the CapFixedOutput property). • The <i>Station</i> parameter is invalid. • The <i>DocumentType</i> is invalid.

OPOS_E_EXTENDED:

ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:

The Fiscal Printer's current state does not allow this state transition.

ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:

There is no paper in the slip station.

Other Values

See **ResultCode**.

See Also **EndFixedOutput** Method, **PrintFixedOutput** Method

BeginInsertion Method

Syntax **LONG BeginInsertion (LONG Timeout);**

The *Timeout* parameter gives the number of milliseconds before failing the method. If zero, the method tries to begin insertion mode, then returns the appropriate status immediately.

If OPOS_FOREVER (-1), the method tries to begin insertion mode, then waits as long as needed until either the form is inserted or an error occurs.

Remarks Called to initiate slip processing.

When called, the slip station is made ready to receive a form by opening the form's handling "jaws" or activating a form insertion mode. This method is paired with the **EndInsertion** method for controlling form insertion.

If the Fiscal Printer device cannot be placed into insertion mode, an error is returned to the application. Otherwise, the Control continues to monitor form insertion until either:

- The form is successfully inserted. In this case, the Control returns an OPOS_SUCCESS status.
- The form is not inserted before *Timeout* milliseconds have elapsed, or an error is reported by the Fiscal Printer device. In this case, the Control either returns OPOS_E_TIMEOUT or another error. The Fiscal Printer device remains in form insertion mode. This allows an application to perform some user interaction and reissue the **BeginInsertion** method without altering the form handling mechanism.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was initiated successfully.
OPOS_E_BUSY	Cannot perform while output is in progress.
OPOS_E_ILLEGAL	The slip station does not exist (see the CapSlpPresent property).
OPOS_E_TIMEOUT	The specified time has elapsed without the form being properly inserted.
<i>Other Values</i>	See ResultCode .

See Also **EndInsertion** Method; **BeginRemoval** Method; **EndRemoval** Method

BeginItemList Method

Syntax **LONG BeginItemList (LONG VatID);**

Parameter	Description
<i>VatID</i>	Vat identifier for reporting.

Remarks Called to initiate a validation report of items belonging to a particular VAT class.

This method is only supported if **CapItemList** is TRUE.

If this method is successful, the **PrinterState** property will be changed to FPTR_PS_ITEM_LIST.

After this method only **VerifyItem** and **EndItemList** methods may be called.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> The Fiscal Printer does not support an item list report (see the CapItemList property). The Fiscal Printer does not support VAT tables (see the CapHasVatTable property).
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer's current state does not allow this state transition.
ResultCodeExtended = OPOS_EFPTR_BAD_VAT:	The <i>VatID</i> parameter is invalid.
<i>Other Values</i>	See ResultCode .

See Also **EndItemList** Method, **VerifyItem** Method

BeginNonFiscal Method

Syntax **LONG BeginNonFiscal ();**

Remarks Called to initiate non-fiscal operations on the Fiscal Printer.

This method is only supported if **CapNonFiscalMode** is TRUE.

Output in this mode is accomplished using the **PrintNormal** method.

This method can be successfully called only if the current value of the **PrinterState** property is FPTR_PS_MONITOR.

If this method is successful, the **PrinterState** property will be changed to FPTR_PS_NONFISCAL.

In order to stop non fiscal modality **EndNonFiscal** method should be called.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress.
OPOS_E_ILLEGAL	The Fiscal Printer does not support non-fiscal output (see the CapNonFiscalMode property).
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer's current state does not allow this state transition.
<i>Other Values</i>	See ResultCode .

See Also **EndNonFiscal** Method, **PrintNormal** Method

BeginRemoval Method

Syntax **LONG BeginRemoval (LONG *Timeout*);**

The *Timeout* property gives the number of milliseconds before failing the method. If zero, the method tries to begin removal mode, then returns the appropriate status immediately.

If OPOS_FOREVER (-1), the method tries to begin removal mode, then waits as long as needed until either the form is removed or an error occurs.

Remarks Called to initiate form removal processing.

When called, the Fiscal Printer is made ready to remove a form by opening the form handling “jaws” or activating a form ejection mode. This method is paired with the **EndRemoval** method for controlling form removal.

If the Fiscal Printer device cannot be placed into removal or ejection mode, an error is returned to the application. Otherwise, the Control continues to monitor form removal until either:

- The form is successfully removed. In this case, the Control returns an OPOS_SUCCESS status.
- The form is not removed before *Timeout* milliseconds have elapsed, or an error is reported by the Fiscal Printer device. In this case, the Control either returns OPOS_E_TIMEOUT or another error. The Fiscal Printer device remains in form removal mode. This allows an application to perform some user interaction and reissue the **BeginRemoval** method without altering the form handling mechanism.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was initiated successfully.
OPOS_E_BUSY	Cannot perform while output is in progress.
OPOS_E_ILLEGAL	The Fiscal Printer does not have a slip station (see the CapSlpPresent property).
OPOS_E_TIMEOUT	The specified time has elapsed without the form being properly removed.
<i>Other Values</i>	See ResultCode .

See Also **BeginInsertion** Method; **EndInsertion** Method; **EndRemoval** Method

BeginTraining Method

Syntax **LONG BeginTraining ();**

Remarks Called to initiate training operations.

This method is only supported if **CapTrainingMode** is TRUE.

Output in this mode is accomplished using the **PrintRec...** methods in order to print a receipt or other methods to print reports.

This method can be successfully called only if the current value of the **PrinterState** property is FPTR_PS_MONITOR.

If this method is successful, the **TrainingModeActive** property will be changed to TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress.
OPOS_E_ILLEGAL	The Fiscal Printer does not support training mode (see the CapTrainingMode property).
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer's current state does not allow this state transition.
<i>Other Values</i>	See ResultCode .

See Also **EndTraining** Method, **PrintRec...** Methods

ClearError Method

Syntax **LONG ClearError ();**

Remarks Called to clear all Fiscal Printer error conditions.
This method is always performed synchronously.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_FAILURE	Error recovery failed.
<i>Other Values</i>	See ResultCode .

EndFiscalDocument Method

Syntax **LONG EndFiscalDocument ();**

Remarks Called to terminate fiscal printing to the slip station.

This method is only supported if **CapSlpFiscalDocument** is TRUE.

If this method is successful, the **PrinterState** property will be changed to FPTR_PS_MONITOR.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress.
OPOS_E_ILLEGAL	The Fiscal Printer does not support fiscal output to the slip station (see the CapSlpFiscalDocument property).
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer is not currently in the Fiscal Document state.
<i>Other Values</i>	See ResultCode .

See Also **BeginFiscalDocument** Method, **PrintFiscalDocumentLine** Method

EndFiscalReceipt Method***Updated in Release 1.6*****Syntax** **LONG EndFiscalReceipt (BOOL *PrintHeader*);**

Parameter	Description
------------------	--------------------

<i>PrintHeader</i>	Indicates if the header lines are to be printed at this time.
--------------------	---

Remarks Called to terminate fiscal printing to the receipt station.

If *PrintHeader* is FALSE, this method will close the current fiscal receipt, print the trailer lines, if they were not already printed after the total lines, and cut it.

If *PrintHeader* is TRUE additionally the header of the next receipt will be printed before cutting the receipt, otherwise the header will be printed when beginning the next receipt.

All functions carried out by this method will be completed before this call returns.

If **CapAdditionalTrailer** is TRUE application specific trailer lines defined by the **AdditionalTrailer** property will be printed after the fiscal trailer lines.

If this method is successful, the **PrinterState** property will be changed to FPTR_PS_MONITOR.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
--------------	----------------

OPOS_SUCCESS	The method was successful.
--------------	----------------------------

OPOS_E_BUSY	Cannot perform while output is in progress.
-------------	---

OPOS_E_EXTENDED:

ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:
The Fiscal Printer is not currently in the Fiscal Receipt Ending state.

Other Values See **ResultCode**.

See Also **BeginFiscalReceipt** Method, **PrintRec...** Methods, **AdditionalTrailer** Property, **CapAdditionalTrailer** Property

EndFixedOutput Method

Syntax **LONG EndFixedOutput ();**

Remarks Called to terminate non-fiscal fixed text printing on a Fiscal Printer station.

 This method is only supported if **CapFixedOutput** is TRUE.

 If this method is successful, the **PrinterState** property will be changed to FPTR_PS_MONITOR.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress.
OPOS_E_ILLEGAL	The Fiscal Printer does not support fixed output (see the CapFixedOutput property).
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer is not currently in the Fixed Output state.
<i>Other Values</i>	See ResultCode .

See Also **BeginFixedOutput** Method, **PrintFixedOutput** Method

EndInsertion Method

Syntax **LONG EndInsertion ();**

Remarks Called to end form insertion processing.

When called, the Fiscal Printer is taken out of form insertion mode. If the slip device has forms “jaws,” they are closed by this method. If a form is detected in the device, a successful status of OPOS_SUCCESS is returned to the application. If no form is present, an extended error status OPOS_EFPTR_SLP_EMPTY is returned.

This method is paired with the **BeginInsertion** method for controlling form insertion. The application may choose to call this method immediately after a successful **BeginInsertion** if it wants to use the Fiscal Printer sensors to determine when a form is positioned within the slip printer. Alternatively, the application may prompt the user and wait for a key press before calling this method.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was initiated successfully.
OPOS_E_ILLEGAL	The Fiscal Printer is not in slip insertion mode.
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:	The device was taken out of insertion mode while the Fiscal Printer cover was open.
ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:	The device was taken out of insertion mode without a form being inserted.
<i>Other Values</i>	See ResultCode .

See Also **BeginInsertion** Method; **BeginRemoval** Method; **EndRemoval** Method

EndItemList Method

Syntax **LONG EndItemList ();**

Remarks Called to terminate a validation report of items belonging to a particular VAT class.

This method is only supported if **CapItemList** is TRUE and **CapHasVatTable** is TRUE.

This method is paired with the **BeginItemList** method.

This method can be successfully called only if current value of **PrinterState** property is equal to FPTR_PS_ITEM_LIST.

If this method is successful, the **PrinterState** property will be changed to FPTR_PS_MONITOR.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> • The Fiscal Printer does not support fixed output (see the CapItemList property). • The Fiscal Printer does not support VAT tables (see the CapHasVatTable property).
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer's current state does not allow this state transition.
<i>Other Values</i>	See ResultCode .

See Also **BeginItemList** Method, **VerifyItem** Method

EndNonFiscal Method

Syntax **LONG EndNonFiscal ();**

Remarks Called to terminate non-fiscal operations on one Fiscal Printer station.

This method is only supported if **CapNonFiscalMode** is TRUE.

If this method is successful, the **PrinterState** property will be changed to FPTR_PS_MONITOR.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress.
OPOS_E_ILLEGAL	The Fiscal Printer does not support non-fiscal output (see the CapNonFiscalMode property).
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer is not currently in the Non-Fiscal state.
<i>Other Values</i>	See ResultCode .

See Also **BeginNonFiscal** Method, **PrintNormal** Method

EndRemoval Method

Syntax **LONG EndRemoval ();**

Remarks Called to end form removal processing.

When called, the Fiscal Printer is taken out of form removal or ejection mode. If no form is detected in the device, a successful status of OPOS_SUCCESS is returned to the application. If a form is present, an extended error status OPOS_EFPTR_SLP_FORM is returned.

This method is paired with the **BeginRemoval** method for controlling form removal. The application may choose to call this method immediately after a successful **BeginRemoval** if it wants to use the Fiscal Printer sensors to determine when the form has been removed. Alternatively, the application may prompt the user and wait for a key press before calling this method.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was initiated successfully.
OPOS_E_ILLEGAL	The Fiscal Printer is not in slip removal mode.
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_SLP_FORM:	
	The device was taken out of removal mode while a form was still present.
<i>Other Values</i>	See ResultCode .

See Also **BeginInsertion** Method; **EndInsertion** Method; **BeginRemoval** Method

EndTraining Method

Syntax **LONG EndTraining ();**

Remarks Called to terminate training operations on either the receipt or slip station.

This method is only supported if **CapTrainingMode** is TRUE.

If this method is successful, the **TrainingModeActive** property will be changed to FALSE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress.
OPOS_E_ILLEGAL	The Fiscal Printer does not support training mode (see the CapTrainingMode property).
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer is not currently in the Training state.
<i>Other Values</i>	See ResultCode .

See Also **BeginTraining** Method, **PrintRec...** Methods

GetData Method

Updated in Release 1.6

Syntax **LONG GetData (LONG DataItem, LONG* OptArgs, BSTR* Data);**

Parameter	Description
<i>DataItem</i>	The specific data item to retrieve.
<i>OptArgs</i>	For some countries, this additional argument may be needed. Consult the Service Object vendor's documentation for details.
<i>Data</i>	Character string to hold the data retrieved.

The *DataItem* parameter values are:

Value	Meaning
<u>Identification data</u>	
FPTR_GD_FIRMWARE	Get the Fiscal Printer's firmware release number.
FPTR_GD_PRINTER_ID	Get the Fiscal Printer's fiscal ID.
<u>Totals</u>	
FPTR_GD_CURRENT_TOTAL	Get the current receipt total.
FPTR_GD_DAILY_TOTAL	Get the daily total.
FPTR_GD_GRAND_TOTAL	Get the Fiscal Printer's grand total.
FPTR_GD_NOT_PAID	Get the current total of not paid receipts.
FPTR_GD_RECEIPT_NUMBER	Get the number of fiscal receipts printed.
FPTR_GD_MID_VOID	Get the total number of voided receipts.
FPTR_GD_REFUND	Get the current total of refunds.
FPTR_GD_REFUND_VOID	Get the current total of voided refunds.
<u>Fiscal memory counts</u>	
FPTR_GD_NUMB_CONFIG_BLOCK	Get the grand number of configuration blocks.
FPTR_GD_NUMB_CURRENCY_BLOCK	Get the grand number of currency blocks.
FPTR_GD_NUMB_HDR_BLOCK	Get the grand number of header blocks.
FPTR_GD_NUMB_RESET_BLOCK	Get the grand number of reset blocks.
FPTR_GD_NUMB_VAT_BLOCK	Get the grand number of VAT blocks.
<u>Counter</u>	
FPTR_GD_FISCAL_DOC	Get the number of daily fiscal documents.
FPTR_GD_FISCAL_DOC_VOID	Get the number of daily voided fiscal documents.

FPTR_GD_FISCAL_REC	Get the number of daily fiscal sales receipts.
FPTR_GD_FISCAL_REC_VOID	Get the number of daily voided fiscal sales receipts.
FPTR_GD_NONFISCAL_DOC	Get the number of daily non fiscal documents.
FPTR_GD_NONFISCAL_DOC_VOID	Get the number of daily voided non fiscal documents.
FPTR_GD_NONFISCAL_REC	Get the number of daily non fiscal receipts.
FPTR_GD_RESTART	Get the Fiscal Printer's restart count.
FPTR_GD_SIMP_INVOICE	Get the number of daily simplified invoices.
FPTR_GD_Z_REPORT	Get the Z report number.

Fixed fiscal printer text

FPTR_GD_TENDER	Get the payment description used in the PrintRecTotal method, defined by the given identifier in the <i>OptArgs</i> argument. Valid only, if CapPredefinedPaymentLines is TRUE.
----------------	---

Linecounter

FPTR_GD_LINECOUNT	Get the number of printed lines, defined by the given identifier in the <i>OptArgs</i> argument. If CapMultiContractor is TRUE, line counters depend on the contractor defined by the ContractorId property.
-------------------	--

Description length

FPTR_GD_DESCRIPTION_LENGTH	Get the maximum number of characters that may be passed as a description parameter for a specific method, defined by the given identifier in the <i>OptArgs</i> argument.
----------------------------	---

If *DataItem* is FPTR_GD_TENDER the *OptArgs* parameter has to be set to one of the following values:

Value	Meaning
-------	---------

FPTR_PDL_CASH	Cash.
FPTR_PDL_CHEQUE	Cheque.
FPTR_PDL_CHITTY	Chitty.
FPTR_PDL_COUPON	Coupon.
FPTR_PDL_CURRENCY	Currency.
FPTR_PDL_DRIVEN_OFF	
FPTR_PDL_EFT_IMPRINTER	Printer EFT.
FPTR_PDL_EFT_TERMINAL	Terminal EFT.
FPTR_PDL_TERMINAL_IMPRINTER	
FPTR_PDL_FREE_GIFT	Gift.
FPTR_PDL_GIRO	Giro.
FPTR_PDL_HOME	Home.
FPTR_PDL_IMPRINTER_WITH_ISSUER	
FPTR_PDL_LOCAL_ACCOUNT	Local account.
FPTR_PDL_LOCAL_ACCOUNT_CARD	Local card account.
FPTR_PDL_PAY_CARD	Pay card.
FPTR_PDL_PAY_CARD_MANUAL	Manual pay card.
FPTR_PDL_PREPAY	Prepay.
FPTR_PDL_PUMP_TEST	Pump test.
FPTR_PDL_SHORT_CREDIT	Credit.
FPTR_PDL_STAFF	Staff.
FPTR_PDL_VOUCHER	Voucher.

If *DataItem* is FPTR_GD_LINECOUNT the *OptArgs* parameter has to be set to one of the following values:

Value	Meaning
FPTR_LC_ITEM	Number of item lines.

FPTR_LC_ITEM_VOID	Number of voided item lines.
FPTR_LC_DISCOUNT	Number of discount lines.
FPTR_LC_DISCOUNT_VOID	Number of voided discount lines.
FPTR_LC_SURCHARGE	Number of surcharge lines.
FPTR_LC_SURCHARGE_VOID	Number of voided surcharge lines.
FPTR_LC_REFUND	Number of refund lines.
FPTR_LC_REFUND_VOID	Number of voided refund lines.
FPTR_LC_SUBTOTAL_DISCOUNT	Number of subtotal discount lines.
FPTR_LC_SUBTOTAL_DISCOUNT_VOID	Number of voided subtotal discount lines.
FPTR_LC_SUBTOTAL_SURCHARGE	Number of subtotal surcharge lines.
FPTR_LC_SUBTOTAL_SURCHARGE_VOID	Number of voided subtotal surcharge lines.
FPTR_LC_COMMENT	Number of comment lines.
FPTR_LC_SUBTOTAL	Number of subtotal lines.
FPTR_LC_TOTAL	Number of total lines.

If *DataItem* is FPTR_GD_DESCRIPTION_LENGTH the *OptArgs* parameter has to be set to one of the following values:

Value	Meaning
FPTR_DL_ITEM	PrintRecItem method.
FPTR_DL_ITEM_ADJUSTMENT	PrintRecItemAdjustment method.
FPTR_DL_ITEM_FUEL	PrintRecItemFuel method.
FPTR_DL_ITEM_FUEL_VOID	PrintRecItemFuelVoid method.
FPTR_DL_NOT_PAID	PrintRecNotPaid method.
FPTR_DL_PACKAGE_ADJUSTMENT	PrintRecPackageAdjustment method.
FPTR_DL_REFUND	PrintRecRefund method.

FPTR_DL_REFUND_VOID	PrintRecRefundVoid method.
FPTR_DL_SUBTOTAL_ADJUSTMENT	PrintRecSubtotalAdjustment method.
FPTR_DL_TOTAL	PrintRecTotal method.
FPTR_DL_VOID	PrintRecVoid method.
FPTR_DL_VOID_ITEM	PrintRecVoidItem method.

Remarks Called to retrieve data from the printer's fiscal module.

If **CapMultiContractor** is TRUE, line counters depend on the contractor defined by the **ContractorId** property.

The data is returned in a string because some of the fields, such as the grand total, might overflow a 4-byte integer.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	The <i>DataItem</i> , <i>OptArgs</i> or ContractorId specified is invalid.
OPOS_E_BUSY	Cannot perform while output is in progress.
<i>Other Values</i>	See ResultCode .

See Also **PrintRecTotal** Method, **CapPredefinedPaymentLines** Property, **ContractorId** Property, **PredefinedPaymentLines** Property

GetDate Method***Updated in Release 1.6***

Syntax	LONG GetDate (BSTR* <i>Date</i>);	
	Parameter	Description
	<i>Date</i>	Date and time returned as a string.
Remarks	Called to get the Fiscal Printer's date and time specified by the DateType property.	
	The date and time are returned as a string in the format "ddmmyyyyhhmm", where:	
	dd	day of the month (1 - 31)
	mm	month (1 - 12)
	yyyy	year (1997-)
	hh	hour (0-23)
	mm	minutes (0-59)
Return	One of the following values is returned by the method and placed in the ResultCode property:	
	Value	Meaning
	OPOS_SUCCESS	The method was successful.
	OPOS_E_ILLEGAL	Retrieval of the date and time is not valid at this time.
	<i>Other Values</i>	See ResultCode .

GetTotalizer Method***Updated in Release 1.6***

Syntax	LONG GetTotalizer (LONG <i>VatID</i>, LONG <i>OptArgs</i>, BSTR* <i>Data</i>);	
	Parameter	Description
	<i>VatID</i>	VAT identifier of the required totalizer.
	<i>OptArgs</i>	For some countries, this additional argument may be needed. Consult the Service Object vendor's documentation for details.
	<i>Data</i>	Totalizer returned as a string.

The *OptArgs* parameter has one of the following values:

Value	Meaning
FPTR_GT_GROSS	Gross totalizer specified by the TotalizerType and ContractorId properties.
FPTR_GT_NET	Net totalizer specified by the TotalizerType and ContractorId properties.
FPTR_GT_DISCOUNT	Discount totalizer specified by the TotalizerType and ContractorId properties.
FPTR_GT_DISCOUNT_VOID	Voided discount totalizer specified by the TotalizerType and ContractorId properties.
FPTR_GT_ITEM	Item totalizer specified by the TotalizerType and ContractorId properties.
FPTR_GT_ITEM_VOID	Voided item totalizer specified by the TotalizerType and ContractorId properties.
FPTR_GT_NOT_PAID	Not paid totalizer specified by the TotalizerType and ContractorId properties.
FPTR_GT_REFUND	Refund totalizer specified by the TotalizerType and ContractorId properties.
FPTR_GT_REFUND_VOID	Voided refund totalizer specified by the TotalizerType and ContractorId properties.
FPTR_GT_SUBTOTAL_DISCOUNT	Subtotal discount totalizer specified by the TotalizerType and ContractorId properties.
FPTR_GT_SUBTOTAL_DISCOUNT_VOID	Voided subtotal discount totalizer specified by the TotalizerType and ContractorId properties.
FPTR_GT_SUBTOTAL_SURCHARGES	Subtotal surcharges totalizer specified by the TotalizerType and ContractorId properties.
FPTR_GT_SUBTOTAL_SURCHARGES_VOID	Voided subtotal surcharges totalizer specified by the TotalizerType and ContractorId properties.

FPTR_GT_SURCHARGE	Surcharges totalizer specified by the TotalizerType and ContractorId properties.
FPTR_GT_SURCHARGE_VOID	Voided surcharges totalizer specified by the TotalizerType and ContractorId properties.
FPTR_GT_VAT	VAT totalizer specified by the TotalizerType and ContractorId properties.
FPTR_GT_VAT_CATEGORY	VAT totalizer per VAT category specified by the TotalizerType and ContractorId properties associated to the given <i>VatID</i> .

Remarks Gets the totalizer specified by the *OptArgs* argument. Some of the totalizers like item or VAT totalizers may be associated with the given *VatID*.

If **CapTotalizerType** is TRUE the type of totalizer (grand, day, receipt specific) depends on the **TotalizerType** property.

If **CapMultiContractor** is TRUE the type depends on the **ContractorId** property.

If **CapSetVatTable** is FALSE then only one totalizer is present.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> • The <i>VatID</i> parameter is invalid. • The ContractorId property is invalid. • The specified totalizer is not available.
<i>Other Values</i>	See ResultCode .

See Also **CapTotalizerType** Property, **TotalizerType** Property, **CapMultiContractor** Property, **ContractorId** Property

GetVatEntry Method

Syntax **LONG GetVatEntry (LONG *VatID*, LONG *OptArgs*, LONG* *VatRate*);**

Parameter	Description
<i>VatID</i>	VAT identifier of the required rate.
<i>OptArgs</i>	For some countries, this additional argument may be needed. Consult the Service Object vendor's documentation for details.
<i>VatRate</i>	Pointer to the rate associated with the VAT identifier.

Remarks Called to get the rate associated with a given VAT identifier.

This method is only supported if **CapSetVatTable** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	The <i>VatID</i> parameters is invalid.
<i>Other Values</i>	See ResultCode .

PrintDuplicateReceipt Method

Syntax **LONG PrintDuplicateReceipt ();**

Remarks Called to print a duplicate of a buffered transaction.

This method is only supported if **CapDuplicateReceipt** is TRUE.

This method will succeed if both the **CapDuplicateReceipt** and **DuplicateReceipt** properties are TRUE.

This method resets the **DuplicateReceipt** property to FALSE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> The Fiscal Printer does not support duplicate receipts (see the CapDuplicateReceipt property). There is no buffered transaction to print (see DuplicateReceipt property).

OPOS_E_EXTENDED:

ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:
The Fiscal Printer is not currently in the Monitor state.

ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:
The journal station is out of paper.

ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:
The receipt station is out of paper.

PrintFiscalDocumentLine Method

Syntax **LONG PrintFiscalDocumentLine (BSTR *DocumentLine*);**

Parameter	Description
<i>DocumentLine</i>	String to be printed on the fiscal slip.

Remarks Called to print a line of fiscal text to the slip station.

This method is only supported if **CapSlpFiscalDocument** is TRUE.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_ILLEGAL	The Fiscal Printer does not support fiscal documents (see the CapSlpFiscalDocument property).
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer is not currently in the Fiscal Document state.
ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:	The Fiscal Printer cover is open. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:	The slip station was specified, but a form is not inserted. (Can only be returned if AsyncMode is FALSE.)
<i>Other Values</i>	See ResultCode .

See Also **BeginFiscalDocument** Method, **EndFiscalDocument** Method

PrintFixedOutput Method

Syntax **LONG PrintFixedOutput (LONG DocumentType, LONG LineNumber, BSTR Data);**

Parameter	Description
<i>DocumentType</i>	Identifier of a document stored in the printer
<i>LineNumber</i>	Number of the line in the document to print.
<i>Data</i>	String parameter for placement in printed line.

Remarks Called to print a line of a fixed document to the print station specified in the **BeginFixedOutput** method. Each call prints a single line from a document by merging the stored text with the parameter *Data*. Within a document lines must be printed sequentially. Some lines are optional and some lines are required, such as the first and last lines.

This method is only supported if **CapFixedOutput** is TRUE.

The Fiscal Printer state is set to FPTR_PS_FIXED_OUTPUT

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none">• The Fiscal Printer does not support fixed output (see the CapFixedOutput property).• The <i>LineNumber</i> is invalid.

OPOS_E_EXTENDED:

ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:

The Fiscal Printer is not currently in the Fixed Output state.

ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:

The Fiscal Printer cover is open.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:

The journal station is out of paper.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:

The receipt station was specified but is out of paper.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:

The slip station was specified, but a form is not inserted.

(Can only be returned if **AsyncMode** is FALSE.)

Other Values

See **ResultCode**.

See Also **BeginFixedOutput** Method, **EndFixedOutput** Method

PrintNormal Method

Syntax **LONG PrintNormal (LONG Station, BSTR Data);**

Parameter	Description
<i>Station</i>	The Fiscal Printer station to be used. May be FPTR_S_RECEIPT, FPTR_S_JOURNAL, FPTR_S_JOURNAL_RECEIPT or FPTR_S_SLIP.
<i>Data</i>	The characters to be printed, consisting mostly of printable characters.

This method performs non-fiscal printing. Escape sequences, carriage returns (13 decimal), and newline / line feed (10 decimal) are available on some printers, but in many cases these are not supported.

The format of this data depends upon the value of the **BinaryConversion** property.

Remarks Called to print *Data* on the printer *Station*.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Special character values within *Data* are:

Value	Meaning
Newline / Line Feed (10 Decimal)	Print any data in the line buffer, and feed to the next print line. (A Carriage Return is not required in order to cause the line to be printed.)
Carriage Return (13 Decimal)	If a Carriage Return immediately precedes a Line Feed, or if the line buffer is empty, then it is ignored. Otherwise, the line buffer is printed and the printer does not feed to the next print line. On some Fiscal Printers, print without feed may be directly supported. On others, a print may always feed to the next line, in which case the Service Object will print the line buffer and perform a reverse line feed if supported. If the printer does not support either of these features, then Carriage Return acts like a Line Feed.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	The specified <i>Station</i> does not exist. (See the CapSlpPresent property.)
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)

OPOS_E_EXTENDED;

ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:
The Fiscal Printer is not currently in the Non-Fiscal state.

ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:
The Fiscal Printer cover is open.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:
The journal station was specified but is out of paper.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:
The receipt station was specified but is out of paper.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:
The slip station was specified, but a form is not inserted.
(Can only be returned if **AsyncMode** is FALSE.)

Other Values See **ResultCode**.

See Also **BeginNonFiscal** Method, **EndNonFiscal** Method, **AsyncMode** property

PrintPeriodicTotalsReport Method

Syntax **LONG PrintPeriodicTotalsReport (BSTR *Date1*, BSTR *Date2*);**

Parameter	Description
<i>Date1</i>	Starting date of report to print.
<i>Date2</i>	Ending date of report to print.

Remarks Called to print a report of totals for a range of dates on the receipt.

This method is always performed synchronously.

The dates are strings in the format “ddmmyyyhhmm”, where:

dd	day of the month (1 - 31)
mm	month (1 - 12)
yyyy	year (1997-)
hh	hour (0-23)
mm	minutes (0-59)

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer’s current state does not allow this state transition.
ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:	The journal station is out of paper.
ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:	The receipt station is out of paper.
ResultCodeExtended = OPOS_EFPTR_BAD_DATE:	One of the date parameters is invalid.
<i>Other Values</i>	See ResultCode .

PrintPowerLossReport Method

Syntax **LONG PrintPowerLossReport ();**

Remarks Called to print on the receipt a report of a power failure that resulted in a loss of data stored in the CMOS of the Fiscal Printer.

This method is only supported if **CapPowerLossReport** is TRUE.

This method is always performed synchronously.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress.
OPOS_E_ILLEGAL	The Fiscal Printer does not support power loss reports (see the CapPowerLossReport property).
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer's current state does not allow this state transition.
ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:	The Fiscal Printer cover is open.
ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:	The journal station is out of paper.
ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:	The receipt station is out of paper.
<i>Other Values</i>	See ResultCode .

PrintRecCash Method***Added in Release 1.6*****Syntax** **LONG PrintRecCash (CURRENCY *Amount*);**

Parameter	Description
-----------	-------------

<i>Amount</i>	Amount to be incremented or decremented.
---------------	--

Remarks Prints a cash-in or cash-out receipt amount on the station specified by the **FiscalReceiptStation** property.

This method is only allowed if **CapFiscalReceiptType** property is TRUE and the **FiscalReceiptType** property is set to FPTR_RT_CASH_IN or FPTR_RT_CASH_OUT and the Fiscal Printer is in the Fiscal Receipt state.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
-------	---------

OPOS_SUCCESS	The method was successful.
--------------	----------------------------

OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
-------------	---

OPOS_E_ILLEGAL	The Fiscal Printer does not support this method.
----------------	--

OPOS_E_EXTENDED:	
------------------	--

ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:
The Fiscal Printer is not currently in the Fiscal Receipt state.

ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:
The Fiscal Printer cover is open.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:
The journal station is out of paper.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:
The receipt station is out of paper.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:

The slip station was specified, but a form is not inserted.
(Can only be returned if **AsyncMode** is FALSE.)

Other Values See **ResultCode**.

See Also **BeginFiscalReceipt** Method, **FiscalReceiptStation** Property,
FiscalReceiptType Property

PrintRecItem Method

Updated in Release 1.6

Syntax **LONG PrintRecItem** (**BSTR** *Description*, **CURRENCY** *Price*, **LONG** *Quantity*,
LONG *VatInfo*, **CURRENCY** *UnitPrice*, **BSTR** *UnitName*)

Parameter	Description
<i>Description</i>	Text describing the item sold.
<i>Price</i>	Price of the line item.
<i>Quantity</i>	Number of items. If zero, a single item is assumed.
<i>VatInfo</i>	VAT rate identifier or amount. If not used a zero is to be transferred.
<i>UnitPrice</i>	Price of each item. If not used a zero is to be transferred.
<i>UnitName</i>	Name of the unit i.e. "kg" or "ltr" or "pcs". If not used an empty string ("") is to be transferred

Remarks Called to print a receipt item for a sold item on the station specified by the **FiscalReceiptStation** property. If the *Quantity* parameter is 0, then a single item quantity will be assumed.

Minimum parameters are *Description* and *Price* or *Description*, *Price*, *Quantity*, and *UnitPrice*. Most countries require *Quantity* and *VatInfo* and some countries also require *UnitPrice* and *UnitName*.

VatInfo contains a VAT table identifier if **CapHasVatTable** is TRUE. Otherwise it contains a VAT amount.

If **CapPostPreLine** is TRUE additional application specific lines defined by the **PostLine** and **PreLine** properties will be printed. After printing these lines **PostLine** and **PreLine** will be reset to an empty string.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer is not currently in the Fiscal Receipt state.
ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:	The Fiscal Printer cover is open. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:	The journal station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:	The receipt station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:	The slip station was specified, but a form is not inserted. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_QUANTITY:	The quantity is invalid. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_BAD_PRICE:	The unit price is invalid. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_DESCRIPTION:	The discount description is too long or contains a reserved word. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_BAD_VAT:	The VAT parameter is invalid. (Can only be returned if AsyncMode is FALSE.)

ResultCodeExtended = OPOS_EFPTR_RECEIPT_TOTAL_OVERFLOW:
The receipt total has overflowed.
(Can only be returned if **AsyncMode** is FALSE.)

Other Values See **ResultCode**.

See Also **BeginFiscalReceipt** Method, **EndFiscalReceipt** Method, **PrintRec...** Methods, **AmountDecimalPlaces** Property, **FiscalReceiptStation** Property, **PostLine** Property, **PreLine** Property

PrintRecItemAdjustment Method

Updated in Release 1.6

Syntax **LONG PrintRecItemAdjustment** (**LONG** *AdjustmentType*, **BSTR** *Description*, **CURRENCY** *Amount*, **LONG** *VatInfo*);

Parameter	Description
<i>AdjustmentType</i>	Type of discount. See below for values.
<i>Description</i>	Text describing the adjustment.
<i>Amount</i>	Amount of the adjustment.
<i>VatInfo</i>	VAT rate identifier or amount.

AdjustmentType can have the following values:

Value	Meaning
FPTR_AT_AMOUNT_DISCOUNT	Fixed amount discount. The <i>Amount</i> parameter contains a currency value.
FPTR_AT_AMOUNT_SURCHARGE	Fixed amount surcharge. The <i>Amount</i> parameter contains a currency value.
FPTR_AT_PERCENTAGE_DISCOUNT	Percentage discount. The <i>Amount</i> parameter contains a percentage value.
FPTR_AT_PERCENTAGE_SURCHARGE	Percentage surcharge. The <i>Amount</i> parameter contains a percentage value.

- Remarks** Called to apply and print a discount or a surcharge to the last receipt item sold on the station specified by the **FiscalReceiptStation** property. This discount may be either a fixed currency amount or a percentage amount relating to the last item.
- If **CapOrderAdjustmentFirst** is true, the method must be called before the corresponding **PrintRecItem** method.
- If **CapOrderAdjustmentFirst** is false, the method must be called after the **PrintRecItem**.
- This discount/surcharge may be either a fixed currency amount or a percentage amount relating to the last item.
- If the discount amount is greater than the receipt subtotal, an error occurs since the subtotal can never be negative.
- In many countries discount operations cause the printing of a fixed line of text expressing the kind of operation that has been performed.
- VatInfo* contains a VAT table identifier if **CapHasVatTable** is TRUE. Otherwise it contains a VAT amount.
- Fixed amount discounts/surcharges are only supported if **CapAmountAdjustment** is TRUE.
- Percentage discounts are only supported if **CapPercentAdjustment** is TRUE.
- If **CapPostPreLine** is TRUE an additional application specific line defined by the **PreLine** property will be printed. After printing this line **PreLine** will be reset to an empty string.
- This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none">• The Fiscal Printer does not support fixed amount adjustments (see the CapAmountAdjustment property).• The Fiscal Printer does not support percentage discounts (see the CapPercentAdjustment property).• The <i>AdjustmentType</i> parameter is invalid.

OPOS_E_EXTENDED:

ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:
The Fiscal Printer is not currently in the Fiscal Receipt state.

ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:
The Fiscal Printer cover is open.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:
The journal station is out of paper.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:
The receipt station is out of paper.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:
The slip station was specified, but a form is not inserted.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_AMOUNT:
The discount amount is invalid.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_DESCRIPTION:
The discount description is too long or contains a reserved word.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_BAD_VAT:
The VAT parameter is invalid.
(Can only be returned if **AsyncMode** is FALSE.)

Other Values See **ResultCode**.

See Also **BeginFiscalReceipt** Method, **EndFiscalReceipt** Method, **PrintRec...** Methods, **AmountDecimalPlaces** Property, **FiscalReceiptStation** Property, **PreLine** Property

PrintRecItemFuel Method***Added in Release 1.6***

Syntax **LONG PrintRecItemFuel (BSTR *Description*, CURRENCY *Price*, LONG *Quantity*, LONG *VatInfo*, CURRENCY *UnitPrice*, BSTR *UnitName*, CURRENCY *SpecialTax*, BSTR *SpecialTaxName*)**

Parameter	Description
<i>Description</i>	Text describing the fuel product.
<i>Price</i>	Price of the fuel item.
<i>Quantity</i>	Number of items, if zero, a single item is assumed.
<i>VatInfo</i>	VAT rate identifier or amount. If not used a zero is to be transferred.
<i>UnitPrice</i>	Price of the fuel item per volume.
<i>UnitName</i>	Name of the volume unit i.e. "ltr". If not used an empty string ("") is to be transferred
<i>SpecialTax</i>	Special tax amount, e.g. road tax. If not used a zero is to be transferred.
<i>SpecialTaxName</i>	Name of the special tax.

Remarks Called to print a receipt fuel item on the station specified by the **FiscalReceiptStation** property.

VatInfo contains a VAT table identifier if **CapHasVatTable** is TRUE. Otherwise it contains a VAT amount.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_ILLEGAL	This method is not supported
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer is not currently in the Fiscal Receipt state.
ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:	The Fiscal Printer cover is open. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:	The journal station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:	The receipt station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:	The slip station was specified, but a form is not inserted. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_QUANTITY:	The quantity is invalid. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_BAD_PRICE:	The unit price is invalid. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_DESCRIPTION:	The discount description is too long or contains a reserved word. (Can only be returned if AsyncMode is FALSE.)

ResultCodeExtended = OPOS_EFPTR_BAD_VAT:
The VAT parameter is invalid.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_TOTAL_OVERFLOW:
The receipt total has overflowed.
(Can only be returned if **AsyncMode** is FALSE.)

Other Values See **ResultCode**.

See Also **BeginFiscalReceipt** Method, **FiscalReceiptStation** Property

PrintRecItemFuelVoid Method

Added in Release 1.6

Syntax **LONG PrintRecItemFuelVoid** (**BSTR Description**, **CURRENCY Price**,
LONG VatInfo, **CURRENCY SpecialTax**)

Parameter	Description
<i>Description</i>	Text describing the fuel product.
<i>Price</i>	Price of the fuel item. If not used a zero is to be transferred.
<i>VatInfo</i>	VAT rate identifier or amount. If not used a zero is to be transferred.
<i>SpecialTax</i>	Special tax amount, e.g. road tax. If not used a zero is to be transferred.

Remarks Called to void a fuel item on the station specified by the **FiscalReceiptStation** property.

If **CapOnlyVoidLastItem** is TRUE, only the last fuel item transferred to the Fiscal Printer can be voided.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_ILLEGAL	This method is not supported.
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer is not currently in the Fiscal Receipt state.
ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:	The Fiscal Printer cover is open. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:	The journal station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:	The receipt station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:	The slip station was specified, but a form is not inserted. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_BAD_PRICE:	The price is invalid. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_DESCRIPTION:	The discount description is too long or contains a reserved word. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_BAD_VAT:	The VAT parameter is invalid. (Can only be returned if AsyncMode is FALSE.)

Other Values See **ResultCode**.

See Also **BeginFiscalReceipt** Method, **EndFiscalReceipt** Method, **PrintRecItemFuel** Method, **CapOnlyVoidLastItem** Property, **FiscalReceiptStation** Property

PrintRecMessage Method

Updated in Release 1.6

Syntax **LONG PrintRecMessage (BSTR Message);**

Parameter	Description
-----------	-------------

<i>Message</i>	Text message to print.
----------------	------------------------

Remarks Called to print a message on the fiscal receipt on the station specified by the **FiscalReceiptStation** property.

The length of an individual message is limited to the number of characters given in the **MessageLength** property.

The kind of message to be printed is defined by the **MessageType** property.

This method is only supported if **CapAdditionalLines** is TRUE.

This method is only supported when the printer is in the Fiscal Receipt Ending state.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer is not currently in the Fiscal Receipt Ending state.
ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:	The Fiscal Printer cover is open. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:	The journal station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:	The receipt station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:	The slip station was specified, but a form is not inserted. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_DESCRIPTION:	The message is too long or contains a reserved word. (Can only be returned if AsyncMode is FALSE.)
<i>Other Values</i>	See ResultCode .

See Also **BeginFiscalReceipt** Method, **EndFiscalReceipt** Method, **PrintRec...** Methods, **MessageLength** property, **CapAdditionalLines** property, **MessageType** Property, **FiscalReceiptStation** Property

PrintRecNotPaid Method***Updated in Release 1.6*****Syntax** **LONG PrintRecNotPaid (BSTR *Description*, CURRENCY *Amount*);**

Parameter	Description
<i>Description</i>	Text describing the not paid amount.
<i>Amount</i>	Amount not paid.

Remarks Called to indicate that part of the receipt's total was not paid.

Some fixed text, along with the *Description*, will be printed on the station specified by the **FiscalReceiptStation** property to indicate that part of the receipt total has not been paid.

This method is only supported if **CapAmountNotPaid** is TRUE.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

If this method is successful, the **PrinterState** property will be changed to either **FPTR_PS_FISCAL_RECEIPT_TOTAL** or **FPTR_PS_FISCAL_RECEIPT_ENDING** depending upon whether the entire receipt total is now accounted for or not.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer is not currently in either the Fiscal Receipt or Fiscal Receipt Total state.
ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:	The Fiscal Printer cover is open. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:	The journal station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:	The receipt station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:	The slip station was specified, but a form is not inserted. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_DESCRIPTION:	The description is too long or contains a reserved word. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_AMOUNT:	The amount is invalid. (Can only be returned if AsyncMode is FALSE.)
<i>Other Values</i>	See ResultCode .

See Also **BeginFiscalReceipt** Method, **EndFiscalReceipt** Method, **PrintRec...** Methods, **AmountDecimalPlaces** Property, **FiscalReceiptStation** Property

PrintRecPackageAdjustment Method***Added in Release 1.6***

Syntax **LONG PrintRecPackageAdjustment (LONG *AdjustmentType*, BSTR *Description*, BSTR *VatAdjustment*);**

Parameter	Description
<i>AdjustmentType</i>	Type of adjustment. See below for values.
<i>Description</i>	Text describing the adjustment.
<i>VatAdjustment</i>	String containing a list of adjustment(s) for different VAT(s).

The *AdjustmentType* parameter has one of the following values:

Value	Meaning
FPTR_AT_DISCOUNT	Discount.
FPTR_AT_SURCHARGE	Surcharge.

The *VatAdjustment* parameter consists of ASCII numeric semicolon delimited pairs of values which denote each VAT identifier of the package item to be adjusted and adjustment amount, separated by comma.

The number of pairs is delimited by the **NumVatRates** property.

Remarks Called to give an adjustment for a package of some items booked before. This adjustment (discount/surcharge) may be either a fixed currency amount or a percentage amount relating to items combined to an adjustment package.

Each item of the package must be transferred before.

Fixed amount adjustments are only supported if **CapPackageAdjustment** is TRUE.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_ILLEGAL	The Fiscal Printer does not support package adjustments (see the CapPackageAdjustment property), or the <i>AdjustmentType</i> parameter is invalid.
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer is not currently in either the Fiscal Receipt state.
ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:	The Fiscal Printer cover is open. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:	The journal station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:	The receipt station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:	The slip station was specified, but a form is not inserted. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_DESCRIPTION:	The description is too long or contains a reserved word. (Can only be returned if AsyncMode is FALSE.)
<i>Other Values</i>	See ResultCode .

See Also **PrintRecPackageAdjustVoid** Method, **CapPackageAdjustment** Property

PrintRecPackageAdjustVoid Method***Added in Release 1.6***

Syntax **LONG PrintRecPackageAdjustVoid** (**LONG** *AdjustmentType*,
BSTR *VatAdjustment*);

Parameter	Description
<i>AdjustmentType</i>	Type of adjustment. See below for values.
<i>VatAdjustment</i>	String containing a list of adjustment(s) for different VAT(s).

The *AdjustmentType* parameter has one of the following values:

Value	Meaning
FPTR_AT_ DISCOUNT	Discount.
FPTR_AT_ SURCHARGE	Surcharge.

The *VatAdjustment* parameter consists of ASCII numeric semicolon delimited pairs of values which denote each VAT identifier of the package item to be adjusted and adjustment amount, separated by comma.

The number of pairs is delimited by the **NumVatRates** property.

Remarks Called to void the adjustment for a package of some items. This adjustment (discount/surcharge) may be either a fixed currency amount or a percentage amount relating to the current receipt subtotal.

Fixed amount void adjustments are only supported if **CapPackageAdjustment** is TRUE.

If **CapPostPreLine** is TRUE an additional application specific line defined by the **PreLine** property will be printed. After printing this line **PreLine** will be reset to an empty string.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_ILLEGAL	The Fiscal Printer does not support package adjustments (see the CapPackageAdjustment property), or the <i>AdjustmentType</i> parameter is invalid.
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer is not currently in either the Fiscal Receipt state.
ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:	The Fiscal Printer cover is open. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:	The journal station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:	The receipt station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:	The slip station was specified, but a form is not inserted. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_DESCRIPTION:	The description is too long or contains a reserved word. (Can only be returned if AsyncMode is FALSE.)
<i>Other Values</i>	See ResultCode .

See Also **PrintRecPackageAdjustment** Method, **CapPackageAdjustment** Property, **PreLine** Property

PrintRecRefund Method***Updated in Release 1.6***

Syntax **LONG PrintRecRefund (BSTR *Description*, CURRENCY *Amount*, LONG *VatInfo*);**

Parameter	Description
<i>Description</i>	Text describing the refund.
<i>Amount</i>	Amount of the refund.
<i>VatInfo</i>	VAT rate identifier or amount.

Remarks Called to process a refund. The *Amount* is positive, but it is printed as a negative number and the totals registers are decremented.

Some fixed text, along with the *Description*, will be printed on station specified by the **FiscalReceiptStation** property to indicate that a refund has occurred.

VatInfo contains a VAT table identifier if **CapHasVatTable** is TRUE. Otherwise it contains a VAT amount.

If **CapPostPreLine** is TRUE an additional application specific line defined by the **PreLine** property will be printed. After printing this line **PreLine** will be reset to an empty string.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer is not currently in the Fiscal Receipt state.
ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:	The Fiscal Printer cover is open. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:	The journal station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:	The receipt station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:	The slip station was specified, but a form is not inserted. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_DESCRIPTION:	The description is too long or contains a reserved word. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_AMOUNT:	The amount is invalid. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_BAD_VAT:	The VAT information is invalid. (Can only be returned if AsyncMode is FALSE.)
<i>Other Values</i>	See ResultCode .

See Also **BeginFiscalReceipt** Method, **EndFiscalReceipt** Method, **PrintRec...** Methods, **AmountDecimalPlaces** Property, **FiscalReceiptStation** Property, **PreLine** Property

PrintRecRefundVoid Method***Added in Release 1.6***

Syntax **LONG PrintRecRefundVoid (BSTR *Description*, CURRENCY *Amount*, LONG *VatInfo*);**

Parameter	Description
<i>Description</i>	Text describing the return.
<i>Amount</i>	Amount of the voided refund.
<i>VatInfo</i>	VAT rate identifier or amount.

Remarks Called to process a void of a refund. The *Amount* is positive and the totals registers are incremented.

Some fixed text, along with the *Description*, will be printed on the station specified by the **FiscalReceiptStation** property to indicate that a void of a refund has occurred.

The *VatInfo* parameter contains a VAT table identifier if **CapHasVatTable** is TRUE. Otherwise it contains a VAT amount.

If **CapOnlyVoidLastItem** is TRUE, only the last refund item transferred to the Fiscal Printer can be voided.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer is not currently in the Fiscal Receipt state.
ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:	The Fiscal Printer cover is open. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:	The journal station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:	The receipt station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:	The slip station was specified, but a form is not inserted. (Can only be returned if AsyncMode is FALSE.)

ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_DESCRIPTION:
The description is too long or contains a reserved word.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_AMOUNT:
The amount is invalid.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_BAD_VAT:
The VAT information is invalid.
(Can only be returned if **AsyncMode** is FALSE.)

Other Values See **ResultCode**.

See Also **PrintRecRefund** Method, **FiscalReceiptStation** Property

PrintRecSubtotal Method***Updated in Release 1.6*****Syntax** **LONG PrintRecSubtotal (CURRENCY *Amount*);**

Parameter	Description
------------------	--------------------

<i>Amount</i>	Amount of the subtotal.
---------------	-------------------------

Remarks Called to check and print the current receipt subtotal on the station specified by the **FiscalReceiptStation** property.

If **CapCheckTotal** is TRUE, the *Amount* is compared to the subtotal calculated by the printer. If the subtotals match, the subtotal is printed on the station specified by the **FiscalReceiptStation** property. If the results do not match, the receipt is automatically canceled. If **CapCheckTotal** is FALSE, then the subtotal is printed on the station specified by the **FiscalReceiptStation** property and the parameter is never compared to the subtotal computed by the Fiscal Printer.

If **CapPostPreLine** is TRUE an additional application specific line defined by the **PostLine** property will be printed. After printing this line **PostLine** will be reset to an empty string.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

If this method compares the application's subtotal with the printer's subtotal and they do not match, the **PrinterState** property will be changed to FPTR_PS_FISCAL_RECEIPT_ENDING.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer is not currently in the Fiscal Receipt state.
ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:	The Fiscal Printer cover is open. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:	The journal station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:	The receipt station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:	The slip station was specified, but a form is not inserted. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_AMOUNT:	The subtotal from the application does not match the subtotal computed by the Fiscal Printer. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_NEGATIVE_TOTAL:	The total computed by the Fiscal Printer is less than zero. (Can only be returned if AsyncMode is FALSE.)
<i>Other Values</i>	See ResultCode .

See Also **BeginFiscalReceipt** Method, **EndFiscalReceipt** Method, **PrintRec...** Methods, **AmountDecimalPlaces** Property, **FiscalReceiptStation** Property, **PostLine** Property

PrintRecSubtotalAdjustment Method***Updated in Release 1.6***

Syntax **LONG PrintRecSubtotalAdjustment (LONG *AdjustmentType*, BSTR *Description*, CURRENCY *Amount*);**

Parameter	Description
<i>AdjustmentType</i>	Type of adjustment. See below for values.
<i>Description</i>	Text describing the discount or surcharge.
<i>Amount</i>	Amount of the adjustment (discount or surcharge).

AdjustmentType can have the following values:

Value	Meaning
FPTR_AT_AMOUNT_DISCOUNT	Fixed amount discount. The <i>Amount</i> parameter contains a currency value.
FPTR_AT_AMOUNT_SURCHARGE	Fixed amount surcharge. The <i>Amount</i> parameter contains a currency value.
FPTR_AT_PERCENTAGE_DISCOUNT	Percentage discount. The <i>Amount</i> parameter contains a percentage value.
FPTR_AT_PERCENTAGE_SURCHARGE	Percentage surcharge. The <i>Amount</i> parameter contains a percentage value.

Remarks Called to apply and print a discount/surcharge to the current receipt subtotal on the station specified by the **FiscalReceiptStation** property. This discount/surcharge may be either a fixed currency amount or a percentage amount relating to the current receipt subtotal.

If the discount/surcharge amount is greater than the receipt subtotal, an error occurs since the subtotal can never be negative.

In many countries discount/surcharge operations cause the printing of a fixed line of text expressing the kind of operation that has been performed.

Fixed amount discounts are only supported if **CapSubAmountAdjustment** is TRUE.

Percentage discounts are only supported if **CapSubPercentAdjustment** is TRUE.

If **CapPostPreLine** is TRUE an additional application specific line defined by the **PreLine** property will be printed. After printing this line **PreLine** will be reset to an empty string.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none">• The Fiscal Printer does not support fixed amount discounts (see the CapSubAmountAdjustment property).• The Fiscal Printer does not support percentage discounts (see the CapSubPercentAdjustment property).• The <i>AdjustmentType</i> parameter is invalid.

OPOS_E_EXTENDED:

ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:
The Fiscal Printer is not currently in the Fiscal Receipt state.

ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:
The Fiscal Printer cover is open.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:
The journal station is out of paper.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:
The receipt station is out of paper.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:
The slip station was specified, but a form is not inserted.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_AMOUNT:
The discount amount is invalid.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_DESCRIPTION:
The discount description is too long or contains a reserved word.
(Can only be returned if **AsyncMode** is FALSE.)

Other Values See **ResultCode**.

See Also **BeginFiscalReceipt** Method, **EndFiscalReceipt** Method, **PrintRec...** Methods, **AmountDecimalPlaces** Property, **FiscalReceiptStation** Property, **PreLine** Property

PrintRecSubtotalAdjustVoid Method***Added in Release 1.6***

Syntax **LONG PrintRecSubtotalAdjustVoid (LONG *AdjustmentType*,
CURRENCY *Amount*);**

Parameter	Description
<i>AdjustmentType</i>	Type of adjustment. See below for values.
<i>Amount</i>	Amount of the adjustment (discount or surcharge).

AdjustmentType can have the following values:

Value	Meaning
FPTR_AT_AMOUNT_DISCOUNT	Fixed amount discount. The <i>Amount</i> parameter contains a currency value.
FPTR_AT_AMOUNT_SURCHARGE	Fixed amount surcharge. The <i>Amount</i> parameter contains a currency value.
FPTR_AT_PERCENTAGE_DISCOUNT	Percentage discount. The <i>Amount</i> parameter contains a percentage value.
FPTR_AT_PERCENTAGE_SURCHARGE	Percentage surcharge. The <i>Amount</i> parameter contains a percentage value.

Remarks Called to void a preceding subtotal adjustment on the station specified by the **FiscalReceiptStation** property. This discount/surcharge may be either a fixed currency amount or a percentage amount relating to the current receipt subtotal.

Fixed amount void discounts are only supported if **CapSubAmountAdjustment** is TRUE.

Percentage void discounts are only supported if **CapSubPercentAdjustment** is TRUE.

If **CapPostPreLine** is TRUE an additional application specific line defined by the **PreLine** property will be printed. After printing this line **PreLine** will be reset to an empty string.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none">• The Fiscal Printer does not support fixed amount discounts (see the CapSubAmountAdjustment property).• The Fiscal Printer does not support percentage discounts (see the CapSubPercentAdjustment property).• The <i>AdjustmentType</i> parameter is invalid.

OPOS_E_EXTENDED:

ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:
The Fiscal Printer is not currently in the Fiscal Receipt state.

ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:
The Fiscal Printer cover is open.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:
The journal station is out of paper.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:
The receipt station is out of paper.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:
The slip station was specified, but a form is not inserted.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_AMOUNT:
The discount amount is invalid.
(Can only be returned if **AsyncMode** is FALSE.)

Other Values See **ResultCode**.

See Also **BeginFiscalReceipt** Method, **EndFiscalReceipt** Method, **PrintRec...** Methods, **AmountDecimalPlaces** Property, **FiscalReceiptStation** Property, **PreLine** Property

PrintRecTaxID Method***Added in Release 1.6*****Syntax** **LONG PrintRecTaxID (BSTR *TaxID*);**

Parameter	Description
------------------	--------------------

<i>TaxID</i>	Customer identification with identification characters and tax number.
--------------	--

Remarks Called to print the customers tax identification on the station specified by the **FiscalReceiptStation** property.

This method is only supported, if the Fiscal Printer is in the Fiscal Receipt Ending state.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_ILLEGAL	The Fiscal Printer does not support printing tax identification
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer is not currently in the Fiscal Receipt Ending state.
ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:	The Fiscal Printer cover is open. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:	The journal station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:	The receipt station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:	The slip station was specified, but a form is not inserted. (Can only be returned if AsyncMode is FALSE.)
<i>Other Values</i>	See ResultCode .

See Also **FiscalReceiptStation** Property

PrintRecTotal Method**Updated in Release 1.6**

Syntax **LONG PrintRecTotal (CURRENCY Total, CURRENCY Payment, BSTR Description);**

Parameter	Description
<i>Total</i>	Application computed receipt total.
<i>Payment</i>	Amount of payment tendered.
<i>Description</i>	Text description of the payment or the index of a predefined payment description.

Remarks Called to check and print the current receipt total on the station specified by the **FiscalReceiptStation** property and to tender a payment.

If **CapCheckTotal** is TRUE, the *Total* is compared to the total calculated by the Fiscal Printer. If the totals match, the total is printed on both the receipt and journal along with some fixed text. If the results do not match, the receipt is automatically canceled. If **CapCheckTotal** is FALSE, then the total is printed on the receipt and journal and the parameter is never compared to the total computed by the Fiscal Printer.

If **CapPredefinedPaymentLines** is TRUE, then the *Description* parameter contains the index of one of the Fiscal Printer's predefined payment descriptions. The index is typically a single character of the alphabet. The set of allowed values for this index is to be described in the description of the service object and stored in the **PredefinedPaymentLines** property.

If *Payment* = *Total*, a line containing the *Description* and *Payment* is printed. The **PrinterState** property will be set to FPTR_PS_FISCAL_RECEIPT_ENDING.

If *Payment* > *Total*, a line containing the *Description* and *Payment* is printed followed by a second line containing the change due. If **CapChangeDue** property is TRUE, a description for the change due defined by the **ChangeDue** property is printed as the second line. The **PrinterState** property will be set to FPTR_PS_FISCAL_RECEIPT_ENDING.

If *Payment* < *Total*, a line containing the *Description* and *Payment* is printed. Since the entire receipt total has not yet been tendered, the **PrinterState** property will be set to FPTR_PS_FISCAL_RECEIPT_TOTAL.

If *Payment* = 0, no line containing the *Description* and *Payment* is printed. The **PrinterState** property will be set to FPTR_PS_FISCAL_RECEIPT_TOTAL.

If **CapAdditionalLines** property is FALSE, then receipt trailer lines, fiscal logotype and receipt cut are executed after the last total line, whenever receipt's total became

equal to the payment from the application. Otherwise these lines are printed calling the **EndFiscalReceipt** method.

If **CapPostPreLine** is TRUE an additional application specific line defined by the **PostLine** property will be printed. After printing this line **PostLine** will be reset to an empty string.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)

OPOS_E_EXTENDED:

ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:

The Fiscal Printer is not currently in the Fiscal Receipt state.

ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:

The Fiscal Printer cover is open.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:

The journal station is out of paper.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:

The receipt station is out of paper.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:

The slip station was specified, but a form is not inserted.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_AMOUNT:

One of the following errors occurred:

- The application computed total does not match the Fiscal Printer computed total.
- The *Total* parameter is invalid.
- The *Payment* parameter is invalid

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_DESCRIPTION:

The description is too long or contains a reserved word.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_NEGATIVE_TOTAL:

The total computed by the Fiscal Printer is less than zero.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_WORD_NOT_ALLOWED:

The description contains the reserved word

Other Values

See **ResultCode**.

See Also **BeginFiscalReceipt** Method, **EndFiscalReceipt** Method, **PrintRec...** Methods, **PredefinedPaymentLines** property, **AmountDecimalPlaces** Property, **ChangeDue** Property, **FiscalReceiptStation** Property, **PostLine** Property

PrintRecVoid Method***Updated in Release 1.6*****Syntax** **LONG PrintRecVoid (BSTR *Description*);**

Parameter	Description
------------------	--------------------

<i>Description</i>	Text describing the void.
--------------------	---------------------------

Remarks Called to cancel the current receipt. The receipt is annulled but it is not physically canceled from the Fiscal Printer's fiscal memory since fiscal receipts are printed with an increasing serial number and totals are accumulated in registers. When a receipt is canceled, its subtotal is subtracted from the totals registers, but it is added to the canceled receipt register.

Some fixed text, along with the *Description*, will be printed on the station specified by the **FiscalReceiptStation** property to indicate that the receipt has been canceled.

Normally only a receipt with at least one transaction can be voided. If **CapEmptyReceiptIsVoidable** is TRUE also an empty receipt (only the **BeginFiscalReceipt** method was called) can be voided.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

If this method is successful, the **PrinterState** property will be changed to FPTR_PS_FISCAL_RECEIPT_ENDING.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer is not currently in the Fiscal Receipt state.
ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:	The Fiscal Printer cover is open. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:	The journal station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:	The receipt station is out of paper. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:	The slip station was specified, but a form is not inserted. (Can only be returned if AsyncMode is FALSE.)
ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_DESCRIPTION:	The description is too long or contains a reserved word. (Can only be returned if AsyncMode is FALSE.)
<i>Other Values</i>	See ResultCode .

See Also **BeginFiscalReceipt** Method, **EndFiscalReceipt** Method, **PrintRec...** Methods

PrintRecVoidItem Method***Updated in Release 1.6***

Syntax **LONG PrintRecVoidItem (BSTR *Description*, CURRENCY *Amount*, LONG *Quantity*, LONG *AdjustmentType*, CURRENCY *Adjustment*, LONG *VatInfo*);**

Parameter	Description
<i>Description</i>	Text description of the item void.
<i>Amount</i>	Amount of item to be voided.
<i>Quantity</i>	Quantity of item to be voided.
<i>AdjustmentType</i>	Type of discount. See below for values.
<i>Adjustment</i>	Amount of the discount/surcharge
<i>VatInfo</i>	VAT rate identifier or amount.

AdjustmentType can have the following values:

Value	Meaning
FPTR_AT_AMOUNT_DISCOUNT	Fixed amount discount. The <i>Adjustment</i> parameter contains a currency value.
FPTR_AT_AMOUNT_SURCHARGE	Fixed amount surcharge. The <i>Adjustment</i> parameter contains a currency value.
FPTR_AT_PERCENTAGE_DISCOUNT	Percentage discount. The <i>Adjustment</i> parameter contains a percentage value.
FPTR_AT_PERCENTAGE_SURCHARGE	Percentage surcharge. The <i>Adjustment</i> parameter contains a percentage value.

Remarks Called to cancel an item that has been added to the receipt and print a void description on the station specified by the **FiscalReceiptStation** property.

Amount is a positive number, it will be printed as a negative and will be decremented from the totals registers.

VatInfo contains a VAT table identifier if **CapHasVatTable** is TRUE. Otherwise it contains a VAT amount.

Fixed amount discounts/surcharges are only supported if **CapAmountAdjustment** is TRUE.

Percentage discounts are only supported if **CapPercentAdjustment** is TRUE.

If **CapOnlyVoidLastItem** is TRUE, only the last item transferred to the Fiscal Printer can be voided.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> The Fiscal Printer does not support fixed amount adjustments (see the CapAmountAdjustment property). The Fiscal Printer does not support percentage discounts (see the CapPercentAdjustment property). The <i>AdjustmentType</i> parameter is invalid.

OPOS_E_EXTENDED:

ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:

The Fiscal Printer is not currently in the Fiscal Receipt state.

ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:

The Fiscal Printer cover is open.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:

The journal station is out of paper.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:

The receipt station is out of paper.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_SLP_EMPTY:

The slip station was specified, but a form is not inserted.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_AMOUNT:

The amount is invalid.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_QUANTITY:

The quantity is invalid.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_BAD_VAT:

The VAT information is invalid.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_DESCRIPTION:

The description is too long or contains a reserved word.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EFPTR_NEGATIVE_TOTAL:

The total computed by the printer is less than zero.

(Can only be returned if **AsyncMode** is FALSE.)

Other Values See **ResultCode**.

See Also **BeginFiscalReceipt** Method, **EndFiscalReceipt** Method, **PrintRec...** Methods, **AmountDecimalPlaces** Property, **CapOnlyVoidLastItem** Property, **FiscalReceiptStation** Property

PrintReport Method

Syntax **LONG PrintReport (LONG *ReportType*, BSTR *StartNum*, BSTR *EndNum*);**

Parameter	Description
<i>ReportType</i>	The kind of report to print.
<i>StartNum</i>	ASCII string identifying the starting record in Fiscal Printer memory from which to begin printing
<i>EndNum</i>	ASCII string identifying the final record in Fiscal Printer memory at which printing is to end. See <i>ReportType</i> table below to find out the exact meaning of this parameter.

ReportType can have the following values:

Value	Meaning
FPTR_RT_ORDINAL	Prints a report between two Z report. If both <i>StartNum</i> and <i>EndNum</i> are valid and <i>EndNum</i> > <i>StartNum</i> , then a report of the period between <i>StartNum</i> and <i>EndNum</i> will be printed. If <i>StartNum</i> is valid and <i>EndNum</i> is 0, then a report of relating only to <i>StartNum</i> will be printed.
FPTR_RT_DATE	Prints a report between two dates. The dates are strings in the format “ddmmyyyyhhmm”, where: dd day of the month (01 - 31) mm month (01 - 12) yyyy year (1997- ...) hh hour (00-23) mm minutes (00-59)

Remarks Called to print a report of the fiscal EPROM contents on the receipt that occurred between two end points.

This method is always performed synchronously.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> * The <i>ReportType</i> parameter is invalid. * One or both of <i>StartNum</i> and <i>EndNum</i> are invalid. * <i>StartNum</i> > <i>EndNum</i>.
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer's current state does not allow this state transition.
ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:	The Fiscal Printer cover is open.
ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:	The journal station is out of paper.
ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:	The receipt station is out of paper.
<i>Other Values</i>	See ResultCode .

PrintXReport Method

Syntax **LONG PrintXReport ();**

Remarks Called to print on the receipt a report of all the daily fiscal activities. No data will be written to the fiscal EPROM as a result of this method invocation.

This method is only supported if **CapXReport** is TRUE.

This method is always performed synchronously.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress.
OPOS_E_ILLEGAL	The Fiscal Printer does not support X reports (see the CapXReport property).
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer's current state does not allow this state transition.
ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:	The Fiscal Printer cover is open.
ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:	The journal station is out of paper.
ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:	The receipt station is out of paper.
<i>Other Values</i>	See ResultCode .

PrintZReport Method

Updated in Release 1.6

Syntax **LONG PrintZReport ();**

Remarks Called to print on the receipt a report of all the daily fiscal activities. Data will be written to the fiscal EPROM as a result of this method invocation.

Since running **PrintZReport** is implicitly a fiscal end of day function, the **DayOpened** property will be set to FALSE.

This method is always performed synchronously.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress.
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer's current state does not allow this state transition.
ResultCodeExtended = OPOS_EFPTR_COVER_OPEN:	The Fiscal Printer cover is open.
ResultCodeExtended = OPOS_EFPTR_JRN_EMPTY:	The journal station is out of paper.
ResultCodeExtended = OPOS_EFPTR_REC_EMPTY:	The receipt station is out of paper.
<i>Other Values</i>	See ResultCode .

See Also **BeginFiscalDocument** Method, **BeginFiscalReceipt** Method, **DayOpened** Property

ResetPrinter Method

Syntax **LONG ResetPrinter ();**

Remarks Called to force the Fiscal Printer to return to Monitor state. This forces any interrupted operations to be canceled and closed. This method must be invoked when the Fiscal Printer is not in a Monitor state after a successful call to the **ClaimDevice** method and successful setting of the **DeviceEnabled** property to TRUE. This typically happens if a power failures occurs during a fiscal operation.

Calling this method does not close the Fiscal Printer, i.e. does not force a Z report to be printed.

The Service Object will handle this command as follows:

- If the Fiscal Printer was in either Fiscal Receipt, Fiscal Receipt Total or Fiscal Receipt Ending state, the receipt will be ended without updating any registers.
- If the Fiscal Printer was in a non-fiscal state, the printer will exit that state.
- If the Fiscal Printer was in the training state, the printer will exit the training state.

This method is always performed synchronously.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
<i>Other Values</i>	See ResultCode .

SetCurrency Method***Added in Release 1.6*****Syntax** **LONG SetCurrency (LONG *NewCurrency*);**

Parameter	Description
------------------	--------------------

<i>NewCurrency</i>	The new currency.
--------------------	-------------------

The *NewCurrency* parameter has one of the following values:

Value	Meaning
--------------	----------------

FPTR_SC_EURO	Change to the EURO currency
--------------	-----------------------------

Remarks Called to change to a new currency, e.g. EURO.

This method is only supported if **CapSetCurrency** is TRUE and can only be called while **DayOpened** is FALSE.

The actual currency is kept in the **ActualCurrency** property.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
--------------	----------------

OPOS_SUCCESS	The method was successful.
--------------	----------------------------

OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none">• The Fiscal Printer does not support not support this method (see CapSetCurrency property).• The Fiscal Printer has already begun the fiscal day (see the DayOpened property).• The specified <i>NewCurrency</i> value is not valid.
----------------	---

<i>Other Values</i>	See ResultCode .
---------------------	-------------------------

See Also **ActualCurrency** Property, **CapSetCurrency** Property, **DayOpened** Property

SetDate Method

Syntax **LONG SetDate (BSTR *Date*);**

Parameter	Description
-----------	-------------

<i>Date</i>	Date and time as a string.
-------------	----------------------------

Remarks Called to set the printer's date and time.

The date and time is passed as a string in the format "ddmmyyyyhhmm", where:

dd	day of the month (1 - 31)
mm	month (1 - 12)
yyyy	year (1997-)
hh	hour (0-23)
mm	minutes (0-59)

This method can only be called while **DayOpened** is FALSE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
-------	---------

OPOS_SUCCESS	The method was successful.
--------------	----------------------------

OPOS_E_ILLEGAL	The Fiscal Printer has already begun the fiscal day (see the DayOpened property).
----------------	--

OPOS_E_EXTENDED:

ResultCodeExtended = OPOS_EFPTR_BAD_DATE:
One of the date parameters is invalid.

<i>Other Values</i>	See ResultCode .
---------------------	-------------------------

See Also **DayOpened** Property

SetHeaderLine Method***Updated in Release 1.6*****Syntax** **LONG SetHeaderLine (LONG *LineNumber*, BSTR *Text*, BOOL *DoubleWidth*);**

Parameter	Description
<i>LineNumber</i>	Line number of the header line to set.
<i>Text</i>	Text to which to set the header line.
<i>DoubleWidth</i>	Print this line in double wide characters.

Remarks Called to set one of the fiscal receipt header lines. The text set by this method will be stored by the Fiscal Printer and retained across power losses.

If **CapMultiContractor** is TRUE, header lines can be defined for different contractors specified by the **ContractorId** property.

LineNumber must be between 1 and the value of the **NumHeaderLines** property.

If *Text* is an empty string (""), then the header line is unset and will not be printed.

DoubleWidth characters will be printed if the printer supports them. See the **CapDoubleWidth** property to determine if they are supported.

This method is only supported if **CapSetHeader** is TRUE.

This method can only be called while **DayOpened** is FALSE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none">• The Fiscal Printer has already begun the fiscal day (see the DayOpened property).• The <i>LineNumber</i> parameter was invalid.

OPOS_E_EXTENDED:

ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_DESCRIPTION:
The *Text* parameter is too long or contains a reserved word.

Other Values See **ResultCode**.

See Also **CapDoubleWidth** Property, **CapMultiContractor** Property,
CapSetHeader Property, **ContractorId** Property, **DayOpened** Property,
NumHeaderLines Property

SetPOSID Method

Syntax **LONG SetPOSID (BSTR *POSID*, BSTR *CashierID*);**

Parameter	Description
<i>POSID</i>	Identifier for the POS system.
<i>CashierID</i>	Identifier of the current cashier.

Remarks Called to set the POS and cashier identifiers. These values will be printed when each fiscal receipt is closed.

This method is only supported if **CapSetPOSID** is TRUE.

This method can only be called while **DayOpened** is FALSE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following error occurred: <ul style="list-style-type: none">• The Fiscal Printer does not support setting the POS identifier (see the CapSetPOSID property).• The Fiscal Printer has already begun the fiscal day (see the DayOpened property).• Either the <i>POSID</i> or <i>CashierID</i> parameter is invalid.
<i>Other Values</i>	See ResultCode .

See Also **CapSetPOSID** Property, **DayOpened** Property

SetStoreFiscalID Method

Syntax **LONG SetStoreFiscalID (BSTR ID);**

Parameter	Description
<i>ID</i>	Fiscal identifier.

Remarks Called to set the store fiscal ID. This value is retained by the Fiscal Printer even after power failures. This ID is automatically printed by the Fiscal Printer after the fiscal receipt header lines.

This method is only supported if **CapSetStoreFiscalID** is TRUE.

This method can only be called while **DayOpened** is FALSE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> The Fiscal Printer does not support setting the store fiscal identifier (see the CapSetStoreFiscalID property). The Fiscal Printer has already begun the fiscal day (see the DayOpened property). The <i>ID</i> parameter was invalid.
<i>Other Values</i>	See ResultCode .

See Also **CapSetStoreFiscalID** Property, **DayOpened** Property

SetTrailerLine Method

Syntax **LONG SetTrailerLine (LONG *LineNumber*, BSTR *Text*, BOOL *DoubleWidth*);**

Parameter	Description
<i>LineNumber</i>	Line number of the trailer line to set.
<i>Text</i>	Text to which to set the trailer line.
<i>DoubleWidth</i>	Print this line in double wide characters.

Remarks Called to set one of the fiscal receipt trailer lines. The text set by this method will be stored by the Fiscal Printer and retained across power losses.

LineNumber must be between 1 and the value of the **NumTrailerLines** property.

If *Text* is an empty string (“”), then the trailer line is unset and will not be printed.

DoubleWidth characters will be printed if the printer supports them. See the **CapDoubleWidth** property to determine if they are supported.

This method is only supported if **CapSetTrailer** is TRUE.

This method can only be called while **DayOpened** is FALSE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> The Fiscal Printer has already begun the fiscal day (see the DayOpened property). The <i>LineNumber</i> parameter was invalid.
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_DESCRIPTION:	The <i>Text</i> parameter is too long or contains a reserved word.
<i>Other Values</i>	See ResultCode .

See Also **CapDoubleWidth** Property, **CapSetTrailer** Property, **DayOpened** Property, **NumTrailerLines** Property

SetVatTable Method

Syntax **LONG SetVatTable ();**

Remarks Called to send the VAT table built inside the Service Object to the Fiscal Printer. The VAT table is built one entry at a time using the **SetVatValue** method.

This method is only supported if **CapHasVatTable** is TRUE.

This method can only be called while **DayOpened** is FALSE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	The Fiscal Printer has already begun the fiscal day (see the DayOpened property).
<i>Other Values</i>	See ResultCode .

See Also SetVatValue Method

SetVatValue Method

Syntax **LONG SetVatValue (LONG *VatID*, BSTR *VatValue*);**

Parameter	Description
<i>VatID</i>	Index of the VAT table entry to set.
<i>VatValue</i>	Tax value as a percentage.

Remarks Called to set the value of a specific VAT class in the VAT table. The VAT table is built one entry at a time in the Service Object using this method. The entire table is then sent to the Fiscal Printer at one time using the **SetVatTable** method.

This method is only supported if **CapHasVatTable** is TRUE.

This method can only be called while **DayOpened** is FALSE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none">• The Fiscal Printer does not support VAT tables (see the CapHasVatTable property).• The Fiscal Printer has already begun the fiscal day (see the DayOpened property).• The Fiscal Printer does not support changing an existing VAT value.
<i>Other Values</i>	See ResultCode .

See Also **SetVatTable** Method

VerifyItem Method

Syntax **LONG VerifyItem (BSTR *ItemName*, LONG *VatID*);**

Parameter	Description
<i>ItemName</i>	Item to be verified.
<i>VatID</i>	VAT identifier of the item.

Remarks Called to compare *ItemName* and its *VatID* with the values stored in the printer.
This method is only supported if **CapHasVatTable** is TRUE.
This method can only be called while the Fiscal Printer is in the Item List state.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	The Fiscal Printer does not support VAT tables (see the CapHasVatTable property).
OPOS_E_EXTENDED:	
ResultCodeExtended = OPOS_EFPTR_WRONG_STATE:	The Fiscal Printer is not currently in the Item List state.
ResultCodeExtended = OPOS_EFPTR_BAD_ITEM_DESCRIPTION:	The item name is too long or contains a reserved word.
ResultCodeExtended = OPOS_EFPTR_BAD_VAT:	The VAT parameter is invalid.
<i>Other Values</i>	See ResultCode .

See Also SetVatTable Method

Events

ErrorEvent Event

Updated in Release 1.6

Syntax **void ErrorEvent (LONG *ResultCode*, LONG *ResultCodeExtended*,
LONG *ErrorLocus*, LONG* *pErrorResponse*);**

Parameter	Description
<i>ResultCode</i>	Result code causing the error event. See ResultCode for values.
<i>ResultCodeExtended</i>	Extended result code causing the error event. See values below.
<i>ErrorLocus</i>	Set to OPOS_EL_OUTPUT: Error occurred while processing asynchronous output.
<i>pErrorResponse</i>	Pointer to the error event response. See values below.

If *ResultCode* is OPOS_E_EXTENDED, then *ResultCodeExtended* is set to one of the following values:

Value	Meaning
OPOS_EFPTR_COVER_OPEN	The Fiscal Printer cover is open.
OPOS_EFPTR_JRN_EMPTY	The journal station is out of paper.
OPOS_EFPTR_REC_EMPTY	The receipt station is out of paper.
OPOS_EFPTR_SLP_EMPTY	A form is not inserted in the slip station.
OPOS_EFPTR_WRONG_STATE	The requested method could not be executed in the Fiscal Printer's current state.
OPOS_EFPTR_TECHNICAL_ASSISTANCE	The Fiscal Printer has encountered a severe error condition. Calling for Fiscal Printer technical assistance is required.
OPOS_EFPTR_CLOCK_ERROR	The Fiscal Printer's internal clock has failed.
OPOS_EFPTR_FISCAL_MEMORY_FULL	The Fiscal Printer's fiscal memory has been exhausted.
OPOS_EFPTR_FISCAL_MEMORY_DISCONNECTED	The Fiscal Printer's fiscal memory has been disconnected.
OPOS_EFPTR_FISCAL_TOTALS_ERROR	The Grand Total in working memory does not match the one in the EPROM.
OPOS_EFPTR_BAD_ITEM_QUANTITY	The Quantity parameter is invalid.
OPOS_EFPTR_BAD_ITEM_AMOUNT	The Amount parameter is invalid.
OPOS_EFPTR_BAD_ITEM_DESCRIPTION	The Description parameters is either too long, contains illegal characters or contains the reserved word.

OPOS_EFPTR_RECEIPT_TOTAL_OVERFLOW

The receipt total has overflowed.

OPOS_EFPTR_BAD_VAT

The Vat parameter is invalid.

OPOS_EFPTR_BAD_PRICE

The Price parameter is invalid.

OPOS_EFPTR_NEGATIVE_TOTAL

The Fiscal Printer's computed total or subtotal is less than zero.

OPOS_EFPTR_MISSING_DEVICES

Some of the other devices which according to the local fiscal legislation are to be connected has been disconnected. In some countries in order to use a Fiscal Printer a full set of peripheral devices are to be connected to the POS (such as cash drawer and customer display). In case one of these devices is not present sales are not allowed.

OPOS_EFPTR_BAD_LENGTH

The length of the string to be printed as post or pre line is too long.

OPOS_EFPTR_MISSING_SET_CURRENCY

The Fiscal Printer is expecting the activation of a new currency.

The contents at the location pointed to by the *pErrorResponse* parameter are preset to the default value of OPOS_ER_RETRY. The application may set the value to one of the following:

Value	Meaning
OPOS_ER_RETRY	Retry the asynchronous output. The error state is exited.
OPOS_ER_CLEAR	Clear the asynchronous output. The error state is exited.

Remarks Fired when an error is detected and the control transitions into the error state.

See Also Printer Error Model (Page 207)

StatusUpdateEvent Event

Syntax **void StatusUpdateEvent (LONG Data);**

The *Data* parameter may be one of the following:

Value	Meaning
FPTR_SUE_COVER_OPEN	Fiscal Printer cover is open.
FPTR_SUE_COVER_OK	Fiscal Printer cover is closed.
FPTR_SUE_JRN_EMPTY	No journal paper.
FPTR_SUE_JRN_NEAREMPTY	Journal paper is low.
FPTR_SUE_JRN_PAPEROK	Journal paper is ready.
FPTR_SUE_REC_EMPTY	No receipt paper.
FPTR_SUE_REC_NEAREMPTY	Receipt paper is low.
FPTR_SUE_REC_PAPEROK	Receipt paper is ready.
FPTR_SUE_SLP_EMPTY	No slip form.
FPTR_SUE_SLP_NEAREMPTY	Almost at the bottom of the slip form.
FPTR_SUE_SLP_PAPEROK	Slip form is inserted.
FPTR_SUE_IDLE	All asynchronous output has finished, either successfully or because output has been cleared. The printer State is now OPOS_S_IDLE. The FlagWhenIdle property must be TRUE for this event to be fired, and the Control automatically resets the property to FALSE just before delivering the event.

Power reporting StatusUpdateEvent values

See **StatusUpdateEvent** description on page 74.

Remarks Fired when a significant status event has occurred.

CHAPTER 8

Hard Totals

StatusUpdateEvent	1.3	Open, Claim, & Enable

General Information

The Hard Totals Control's OLE programmatic ID is "OPOS.Totals".

Capabilities

The Hard Totals device has the following minimal set of capabilities:

- Supports at least one totals file with the name "" (the empty string) in an area of totals memory. Each totals file is read and written as if it were a sequence of byte data.
- Each totals file is created with a fixed size and may be deleted, initialized, and claimed for exclusive use.
- Totals memory is frequently a limited but secure resource - perhaps of only several thousand bytes of storage.

The Hard Totals device may have the following additional capabilities:

- Supports additional named totals files. They share some characteristics of a file system with only a root directory level. In addition to the minimal capabilities listed above, each totals file may also be renamed.
- Supports transactions, with begin and commit operations, plus rollback.
- Supports advanced error detection. This detection may be implemented through hardware or software.

Model

The following is the general model of the Hard Totals:

- A Hard Totals device is logically treated as a sequence of byte data, which the application subdivides into “totals files.” This is done by the **Create** method, which assigns a name, size, and error detection level to the totals file. Totals files have a fixed-length that is set at **Create** time.

At a minimum, a single totals file with the name “” (the empty string) can be created and manipulated. Optionally, additional totals files with arbitrary names may be created.

Totals files model many of the characteristics of a traditional file system. The intent, however, is not to provide a robust file system. Rather, totals files allow partitioning and ease of access into what is frequently a limited but secure resource. In order to reduce unnecessary overhead usage of this resource, directory hierarchies are not supported, file attributes are minimized, and files may not be dynamically resized.

- The following operations may be performed on a totals file:
 - ◆ **Read**: Read a series of data bytes.
 - ◆ **Write**: Write a series of data bytes.
 - ◆ **SetAll**: Set all the data in a totals file to a value.
 - ◆ **Find**: Locate an existing totals file by name, and return a file handle and size.
 - ◆ **FindByIndex**: Used to enumerate all of the files in the Hard Totals area.
 - ◆ **Delete**: Delete a totals file by name.
 - ◆ **Rename**: Rename an existing totals file.
 - ◆ **ClaimFile**: Gain exclusive access to a specific file for use by the claiming application. A timeout value may be specified in case another application maintains access for a period a time.
The common **ClaimDevice** method may also be used to claim the entire Hard Totals device.
 - ◆ **ReleaseFile**: Releases exclusive access to the file.
- The **FreeData** property holds the current number of unassigned data bytes.
- The **TotalsSize** property holds the totals memory size.

- The **NumberOfFiles** property holds the number of totals files that exist in the hard totals device.
- Transaction operations are optionally supported. A transaction is defined as a series of data writes to be applied as an atomic operation to one or more Hard Totals files.

During a transaction, data writes will typically be maintained in memory until a commit or rollback. Also **FreeData** will typically be reduced during a transaction to ensure that the commit has temporary totals space to perform the commit as an atomic operation.

- ◆ **BeginTrans**: Marks the beginning of a transaction.
- ◆ **CommitTrans**: Ends the current transaction, and saves the updated data. Software and/or hardware methods are used to ensure that either the entire transaction is saved, or that none of the updates are applied. This will typically require writing the transaction to temporary totals space, setting state information within the device indicating that a commit is in progress, writing the data to the totals files, and freeing the temporary totals space. If the commit is interrupted, perhaps due to a system power loss or reset, then when the Hard Totals service object is reloaded and initialized, it can complete the commit by copying data from the temporary space into the totals files. This ensures the integrity of related totals data.
- ◆ **Rollback**: Ends the current transaction, and discards the updates. This may be useful in case of user intervention to cancel an update. Also, if advanced error detection shows that some totals data cannot be read properly in preparation for an update, then the transaction may need to be aborted.
- ◆ **TransactionInProgress**: This property holds the current state of transactions.

The application should claim the files used during a transaction so that no other Hard Totals Control claims a file before **CommitTrans**, causing the commit to fail, returning an already claimed status.

- Advanced error detection is optionally supported by the following:
 - ◆ A **Read** or a **Write** may report a validation error. Data is usually divided into validation blocks, over which sumchecks or CRCs are maintained. The size of validation data blocks is determined by the specific Service Object.

A validation error informs the application that one or more of the validation blocks containing the data to be read or written may be invalid due to a hardware error. (An error on a **Write** can occur when only a portion of a validation block must be changed. The validation block must be read and the block validated before the portion is changed.)

When a validation error is reported, it is recommended that the application read all of the data in the totals file. The application will want to determine which portions of data are invalid, and take action based on the results of the reads.
 - ◆ **RecalculateValidationData** may be called to cause recalculation of all validation data within a totals file. This may be called after recovery has been performed as in the previous paragraph.
 - ◆ **ValidateData** may be called to verify that all data within a totals file passes validation.
 - ◆ Data **Writes** automatically cause recalculation of validation data for the validation block or blocks in which the written data resides.
 - ◆ Since advanced error detection usually imposes a performance penalty, the application may choose to select this feature when each totals file is created.

Device Sharing

The hard totals device is sharable. Its device sharing rules are:

- After opening the device, most properties are readable.
- After opening and enabling the device, the application may access all properties and methods.
- If more than one application has opened and enabled the device, all applications may access its properties and methods.
- One application may claim the hard totals device. This restricts all other applications from reading, changing, or claiming any files on the device.
- One application may claim a hard totals file. This restricts all other applications from reading, changing, or claiming the file, and from claiming the hard totals device.

Properties

CapErrorDetection Property

Syntax	BOOL CapErrorDetection;
Remarks	If TRUE, then advanced error detection is supported; otherwise it is FALSE. This property is initialized by the Open method.

CapSingleFile Property

Syntax	BOOL CapSingleFile;
Remarks	If TRUE, then only a single file, identified by the empty string (""), is supported; otherwise it is FALSE. This property is initialized by the Open method.

CapTransactions Property

Syntax	BOOL CapTransactions;
Remarks	If TRUE, then transactions are supported; otherwise it is FALSE. This property is initialized by the Open method.

FreeData Property

- Syntax** **LONG FreeData;**
- Remarks** Holds the number of bytes of unallocated data in the Hard Totals device.
- Its value is initialized to an appropriate value when the device is enabled and is updated as files are **Created** and **Deleted**. If creating a file requires some overhead to support the file information, then **FreeData** is reduced by this overhead amount. This guarantees that a new file of size **FreeData** may be created.
- Data writes within a transaction may temporarily reduce **FreeData**, since some Hard Totals space may need to be allocated to prepare for the transaction commit. Therefore, the application should ensure that sufficient **FreeData** is maintained to allow its maximally sized transactions to be performed.
- See Also** **Create Method; Write Method**

NumberOfFiles Property

- Syntax** **LONG NumberOfFiles;**
- Remarks** Holds the number of totals file currently in the Hard Totals device.
- This property is initialized and kept current while the device is enabled.
- See Also** **FreeData Property**

TotalsSize Property

- Syntax** **LONG TotalsSize;**
- Remarks** Holds the size of the Hard Totals area. This size is equal to the largest totals file that can be created if no other files exist.
- This property is initialized when the device is enabled.
- See Also** **FreeData Property**

TransactionInProgress Property

Syntax	BOOL TransactionInProgress;
Remarks	<p>If TRUE, then the application is within a transaction; otherwise it is FALSE.</p> <p>This property is initialized to FALSE by the Open method.</p>
See Also	BeginTrans Method

Methods

BeginTrans Method

Syntax	LONG BeginTrans ();								
Remarks	Marks the beginning of a series of Hard Totals writes that must either be applied as a group or not at all.								
Return	One of the following values is returned by the method and placed in the ResultCode property:								
	<table><tr><th>Value</th><th>Meaning</th></tr><tr><td>OPOS_SUCCESS</td><td>The method was successful.</td></tr><tr><td>OPOS_E_ILLEGAL</td><td>Transactions are not supported by this device.</td></tr><tr><td><i>Other Values</i></td><td>See ResultCode.</td></tr></table>	Value	Meaning	OPOS_SUCCESS	The method was successful.	OPOS_E_ILLEGAL	Transactions are not supported by this device.	<i>Other Values</i>	See ResultCode .
Value	Meaning								
OPOS_SUCCESS	The method was successful.								
OPOS_E_ILLEGAL	Transactions are not supported by this device.								
<i>Other Values</i>	See ResultCode .								
See Also	CommitTrans Method; Rollback Method								

ClaimDevice Method (Common)

Syntax **LONG ClaimDevice (LONG *Timeout*);**

The *Timeout* parameter gives the maximum number of milliseconds to wait for exclusive access to be satisfied.

If zero, the method attempts to claim the device, then returns the appropriate status immediately.

If OPOS_FOREVER (-1), the method waits as long as needed until exclusive access is satisfied.

Remarks Call this method to request exclusive access to the device.

If any other application has claimed exclusive access to any of the hard totals files by using **ClaimFile**, then this **ClaimDevice** cannot be satisfied until those files are released by **ReleaseFile**.

When successful, the **Claimed** property is changed to TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	Exclusive access has been granted. The Claimed property is now TRUE. Also returned if this application has already claimed the device.
OPOS_E_ILLEGAL	An invalid <i>Timeout</i> parameter was specified.
OPOS_E_TIMEOUT	Another application has exclusive access to the device or one or more of its files and did not relinquish control before <i>Timeout</i> milliseconds expired.

See Also “Device Sharing Model”; **ReleaseDevice** Method; **ClaimFile** Method; **ReleaseFile** Method

ClaimFile Method

Syntax **LONG ClaimFile (LONG HTotalsFile, LONG Timeout);**

Parameter	Description
<i>HTotalsFile</i>	Handle to the totals file that is to be claimed.
<i>Timeout</i>	The time in milliseconds to wait for the file to become available. If zero, the method attempts to claim the file, then returns the appropriate status immediately. If OPOS_FOREVER (-1), the method waits as long as needed until exclusive access is satisfied.

Remarks Attempts to gain exclusive access to a specific file for use by the claiming application. Once granted, the application maintains exclusive access until it explicitly releases access or until the device is closed.

If any other applications have claimed exclusive access to this file by using **ClaimFile**, or if any other application has claimed exclusive access to the entire totals area by using **ClaimDevice**, then this **ClaimFile** cannot be satisfied until those claims have been released.

All claims are released when the application calls the **Close** method.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	The handle is invalid, or an invalid <i>Timeout</i> parameter was specified.
OPOS_E_TIMEOUT	The <i>Timeout</i> value expired before another application released exclusive access of either the requested totals file or the entire totals area.

See Also **ClaimDevice** Method; **ReleaseFile** Method

CommitTrans Method

Syntax **LONG CommitTrans ();**

Remarks Ends the current transaction. All writes between the previous **BeginTrans** method and this method are saved to the Hard Totals areas.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	Transactions are not supported by this device, or no transaction is in progress.
<i>Other Values</i>	See ResultCode .

See Also **BeginTrans** Method; **Rollback** Method

Create Method

Syntax **LONG Create (BSTR *FileName*, LONG* *pHTotalsFile*, LONG *Size*, BOOL *ErrorDetection*);**

Parameter	Description
<i>FileName</i>	The name to be assigned to the file. Must be no longer than 10 characters. All displayable characters – characters ≥ 20-hex – are valid.
<i>pHTotalsFile</i>	Pointer to the handle of the newly created totals file. Set by the method.
<i>Size</i>	The length of the file in bytes. Once created, the file size cannot be changed – totals files are fixed-length files.
<i>ErrorDetection</i>	The level of error detection desired for this file: If TRUE, then the Service Object will enable advanced error detection if supported. If FALSE, then higher performance access is required, so advanced error detection need not be enabled for this file.

Remarks Creates a totals file with the specified name, size, and error detection level. The data area is initialized to binary zeros.

If **CapSingleFile** is TRUE, then only one file may be created, and its name must be the empty string (“”). Otherwise, the number of totals files that may be created is limited only by the free space available in the Hard Totals area.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_CLAIMED	Cannot create because the entire totals file area is claimed by another application.
OPOS_E_ILLEGAL	The <i>FileName</i> is too long or contains invalid characters.
OPOS_E_EXISTS	<i>FileName</i> already exists.
OPOS_E_EXTENDED	ResultCodeExtended = OPOS_ETOT_NOROOM: There is insufficient room in the totals area to create the file.
<i>Other Values</i>	See ResultCode .

See Also **Find Method**; **Delete Method**; **Rename Method**

Delete Method

Syntax **LONG Delete (BSTR *FileName*);**

The *FileName* parameter specifies the totals file to be deleted.

Remarks Delete the named file.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_CLAIMED	Cannot delete because either the totals file or the entire totals area is claimed by another application.
OPOS_E_ILLEGAL	The <i>FileName</i> is too long or contains invalid characters.
OPOS_E_NOEXIST	<i>FileName</i> was not found.
<i>Other Values</i>	See ResultCode .

See Also **Create Method**; **Find Method**; **Rename Method**

Find Method

Syntax **LONG Find (BSTR *FileName*, LONG* *pHTotalsFile*, LONG* *pSize*);**

Parameter	Description
<i>FileName</i>	The totals file name to be located.
<i>pHTotalsFile</i>	Pointer to the handle of the totals file. Set by the method.
<i>pSize</i>	Pointer to the length of the file in bytes. Set by the method.

Remarks Locates an existing totals file.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_CLAIMED	Cannot find because the entire totals file area is claimed by another application.
OPOS_E_ILLEGAL	The <i>FileName</i> is too long or contains invalid characters.
OPOS_E_NOEXIST	<i>FileName</i> was not found.
<i>Other Values</i>	See ResultCode .

See Also **Create Method**; **Delete Method**; **Rename Method**

FindByIndex Method

Syntax **LONG FindByIndex (LONG *Index*, BSTR* *pFileName*);**

Parameter	Description
<i>Index</i>	The index of the totals file name to be found.
<i>pFileName</i>	Pointer to the totals file name to be returned. Set by the method.

Remarks Returns the totals file name currently associated with the given **index**.

This method provides a means for enumerating all of the totals files currently defined. An *Index* of zero will return the file name at the first file position, with subsequent indices returning additional file names. The largest valid *Index* value is one less than **NumberOfFiles**.

The creation and deletion of files may change the relationship between indices and the file names, as the Control may compact or rearrange the data areas used to manage file names and attributes at these times. Therefore, the application may need to claim the device to ensure that all file names are retrieved successfully.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_CLAIMED	Cannot find because the entire totals file area is claimed by another application.
OPOS_E_ILLEGAL	The <i>Index</i> is greater than the largest file index that is currently defined.
<i>Other Values</i>	See ResultCode .

See Also **Create Method**; **Find Method**

Read Method

Syntax **LONG Read (LONG HTotalsFile, BSTR* pData, LONG Offset, LONG Count);**

Parameter	Description
<i>HTotalsFile</i>	Totals file handle returned from a Create or Find method.
<i>pData</i>	Pointer to the data buffer in which the totals data will be placed. The format of this data depends upon the value of the BinaryConversion property. See page 39.
<i>Offset</i>	Starting offset for the data to be read.
<i>Count</i>	Number of bytes of data to read.

Remarks Read data from a totals file.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_CLAIMED	Cannot read because either the totals file or the entire totals area is claimed by another application.
OPOS_E_ILLEGAL	The handle is invalid, or part of the data range is outside the bounds of the totals file.
OPOS_E_EXTENDED	ResultCodeExtended = OPOS_ETOT_VALIDATION: A validation error has occurred while reading data.
<i>Other Values</i>	See ResultCode .

See Also **Write Method**

RecalculateValidationData Method

Syntax **LONG RecalculateValidationData (LONG HTotalsFile);**

The *HTotalsFile* parameter contains the handle of a totals file.

Remarks Recalculates validation data for the specified totals file.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_CLAIMED	Cannot recalculate because either the totals file or the entire totals area is claimed by another application.
OPOS_E_ILLEGAL	The handle is invalid, or advanced error detection is either not supported by the Service Object or by this file.
<i>Other Values</i>	See ResultCode .

ReleaseDevice Method (Common)

Syntax **LONG ReleaseDevice ();**

Remarks Call this method to release exclusive access to the device.

An application may own claims on both the Hard Totals device through **ClaimDevice** as well as individual files through **ClaimFile**. Calling **ReleaseDevice** only releases the claim on the Hard Totals device.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	Exclusive access has been released. The Claimed property is now FALSE.
OPOS_E_ILLEGAL	The application does not have exclusive access to the device.

See Also “Device Sharing Model”; **ClaimDevice** Method; **ClaimFile** Method

ReleaseFile Method

Syntax **LONG ReleaseFile (LONG *HTotalsFile*);**

The *HTotalsFile* parameter contains the handle of the totals file to be released.

Remarks Releases exclusive access to a specific file.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	The handle is invalid, or the specified file is not claimed by this application.

See Also **ClaimDevice** Method; **ClaimFile** Method

Rename Method

Syntax **LONG Rename (LONG *HTotalsFile*, BSTR *FileName*);**

Parameter	Description
<i>HTotalsFile</i>	Handle of the totals file to be renamed.
<i>FileName</i>	The new name to be assigned to the file. The name must be no longer than 10 characters. All displayable characters – characters ≥ 20-hex – are valid.

Remarks Renames a totals file.

If **CapSingleFile** is TRUE, then this method will fail.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_CLAIMED	Cannot rename because either the totals file or the entire totals area is claimed by another application.
OPOS_E_ILLEGAL	The file handle is invalid, the <i>FileName</i> is too long or contains invalid characters, or the CapSingleFile property is TRUE.
OPOS_E_EXISTS	<i>FileName</i> already exists.
<i>Other Values</i>	See ResultCode .

Rollback Method

Syntax	LONG Rollback ();								
Remarks	Ends the current transaction. All writes between the previous BeginTrans and this method are discarded; they are not saved to the Hard Totals areas.								
Return	One of the following values is returned by the method and placed in the ResultCode property: <table><tr><th>Value</th><th>Meaning</th></tr><tr><td>OPOS_SUCCESS</td><td>The method was successful.</td></tr><tr><td>OPOS_E_ILLEGAL</td><td>Transactions are not supported by this device, or no transaction is in progress.</td></tr><tr><td><i>Other Values</i></td><td>See ResultCode.</td></tr></table>	Value	Meaning	OPOS_SUCCESS	The method was successful.	OPOS_E_ILLEGAL	Transactions are not supported by this device, or no transaction is in progress.	<i>Other Values</i>	See ResultCode .
Value	Meaning								
OPOS_SUCCESS	The method was successful.								
OPOS_E_ILLEGAL	Transactions are not supported by this device, or no transaction is in progress.								
<i>Other Values</i>	See ResultCode .								
See Also	BeginTrans Method; CommitTrans Method								

SetAll Method

Syntax	LONG SetAll (LONG HTotalsFile, LONG Value);								
	<table><tr><th>Parameter</th><th>Description</th></tr><tr><td><i>HTotalsFile</i></td><td>Handle of a totals file.</td></tr><tr><td><i>Value</i></td><td>Value to set is in the low byte.</td></tr></table>	Parameter	Description	<i>HTotalsFile</i>	Handle of a totals file.	<i>Value</i>	Value to set is in the low byte.		
Parameter	Description								
<i>HTotalsFile</i>	Handle of a totals file.								
<i>Value</i>	Value to set is in the low byte.								
Remarks	Set all the data in a totals file to the specified value.								
Return	One of the following values is returned by the method and placed in the ResultCode property: <table><tr><th>Value</th><th>Meaning</th></tr><tr><td>OPOS_SUCCESS</td><td>The method was successful.</td></tr><tr><td>OPOS_E_CLAIMED</td><td>Cannot set because either the totals file or the entire totals area is claimed by another application.</td></tr><tr><td><i>Other Values</i></td><td>See ResultCode.</td></tr></table>	Value	Meaning	OPOS_SUCCESS	The method was successful.	OPOS_E_CLAIMED	Cannot set because either the totals file or the entire totals area is claimed by another application.	<i>Other Values</i>	See ResultCode .
Value	Meaning								
OPOS_SUCCESS	The method was successful.								
OPOS_E_CLAIMED	Cannot set because either the totals file or the entire totals area is claimed by another application.								
<i>Other Values</i>	See ResultCode .								

ValidateData Method

Syntax **LONG ValidateData (LONG HTotalsFile);**

The *HTotalsFile* parameter contains the handle of a totals file.

Remarks Verifies that all data in the specified totals file passes validation checks.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_CLAIMED	Cannot validate because either the totals file or the entire totals area is claimed by another application.
OPOS_E_ILLEGAL	The handle is invalid, or advanced error detection is either not supported by the Service Object or by this file.
<i>Other Values</i>	See ResultCode .

Write Method

Syntax **LONG Write (LONG HTotalsFile, BSTR Data, LONG Offset, LONG Count);**

Parameter	Description
<i>HTotalsFile</i>	Totals file handle returned from a Create or Find method.
<i>Data</i>	Data buffer containing the totals data to be written. The format of this data depends upon the value of the BinaryConversion property. See page 39.
<i>Offset</i>	Starting offset for the data to be written.
<i>Count</i>	Number of bytes of data to write.

Remarks Write data to a totals file.

If a transaction is in progress, then the write will be buffered until a **CommitTrans** or **Rollback** method is called.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_CLAIMED	Cannot write because either the totals file or the entire totals area is claimed by another application.
OPOS_E_ILLEGAL	The handle is invalid, or part of all of the data range is outside the bounds of the totals file.
OPOS_E_EXTENDED	ResultCodeExtended = OPOS_ETOT_NOROOM: Cannot write because a transaction is in progress, and there is not enough free space to prepare for the transaction commit.
	ResultCodeExtended = OPOS_ETOT_VALIDATION: A validation error has occurred while reading data.
<i>Other Values</i>	See ResultCode .

See Also **Read** Method; **BeginTrans** Method; **CommitTrans** Method; **Rollback** Method; **FreeData** Property

General Information

The Keylock Control's OLE programmatic ID is "OPOS.Keylock".

Capabilities

The keylock has the following minimal set of capabilities:

- Supports at least three keylock positions.
- Supports reporting of keylock position changes, either by hardware or software detection.

Model

The keylock defines three keylock positions as constants. It is assumed that the keylock supports locked, normal, and supervisor positions. The constants for these keylock positions and their values are as follows:

- LOCK_KP_LOCK 1
- LOCK_KP_NORM 2
- LOCK_KP_SUPR 3

The **KeyPosition** property holds the value of the keylock position where the values range from one (1) to the total number of keylock positions contained in the **PositionCount** property.

Device Sharing

The keylock is sharable. Its device sharing rules are:

- After opening and enabling the device, the application may access all properties and methods and will receive status update events.
- If more than one application has opened and enabled the device, each of these applications may access its properties and methods. Status update events are fired to all of these applications.
- The keylock may not be claimed for exclusive access. If an application calls **ClaimDevice**, the method always return OPOS_E_ILLEGAL.
- See the "Summary" table for precise usage prerequisites.

Properties

KeyPosition Property

Syntax **LONG KeyPosition;**

Remarks Holds a value which indicates the keylock position.

This value is set by the Control whenever the keylock position is changed. In addition to the application receiving the **StatusUpdateEvent**, this value is changed to reflect the new keylock position.

The **KeyPosition** property may hold one of the following values:

Value	Meaning
LOCK_KP_LOCK	Keylock is in the “locked” position. Value is one (1).
LOCK_KP_NORM	Keylock is in the “normal” position. Value is two (2).
LOCK_KP_SUPR	Keylock is in the “supervisor” position. Value is three (3).
<i>Other Values</i>	Keylock is in one of the auxiliary positions. This value may range from four (4) up to the total number of keylock positions indicated by the PositionCount property.

This property is initialized and kept current while the device is enabled.

PositionCount Property

Syntax **LONG PositionCount;**

Remarks Holds the total number of keylock positions.

Contains the total number of positions that are present on the keylock device.

This property is initialized by the **Open** method.

Methods

WaitForKeylockChange Method

Syntax **LONG WaitForKeylockChange (LONG *KeyPosition*, LONG *Timeout*);**

Parameter	Description
<i>KeyPosition</i>	Requested keylock position. See values below.
<i>Timeout</i>	Maximum number of milliseconds to wait for the keylock before returning control back to the application. If zero, the method then returns the appropriate status immediately. If OPOS_FOREVER (-1), the method waits as long as needed until the requested key position is satisfied or an error occurs.

The *KeyPosition* parameter may contain one of the following values:

Value	Meaning
LOCK_KP_ANY	Wait for any keylock position change. Value is zero.
LOCK_KP_LOCK	Wait for keylock position to be set to the “locked” position. Value is one (1).
LOCK_KP_NORM	Wait for keylock position to be set to the “normal” position. Value is two (2).
LOCK_KP_SUPR	Wait for keylock position to be set to the “supervisor” position. Value is three (3).
<i>Other Values</i>	Wait for keylock position to be set to one of the auxiliary positions. This value may range from four (4) up to the total number of keylock positions indicated by the PositionCount property.

Remarks Call to wait for a specified keylock position to be set.

If the keylock position specified by the *KeyPosition* parameter is the same as the current keylock position, then the method returns immediately.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The keylock is in the specified position. If <i>KeyPosition</i> is LOCK_KP_ANY, then the keylock position has changed.
OPOS_E_ILLEGAL	An invalid parameter value was specified.
OPOS_E_TIMEOUT	The timeout period expired before the requested keylock positioning occurred.
<i>Other Values</i>	See ResultCode .

Events

StatusUpdateEvent Event

Syntax `void StatusUpdateEvent (LONG Status);`

The *Status* parameter contains the updated keylock position. The following keylock position values may be set:

Value	Meaning
LOCK_KP_LOCK	Keylock is in the “locked” position. Value is one (1).
LOCK_KP_NORM	Keylock is in the “normal” position. Value is two (2).
LOCK_KP_SUPR	Keylock is in the “supervisor” position. Value is three (3).
<i>Other Values</i>	Keylock is in one of the auxiliary positions. This value may range from four (4) to the total number of keylock positions indicated by the PositionCount property.

Power reporting StatusUpdateEvent values

See **StatusUpdateEvent** description on page 74.

Remarks Fired when the keylock position changes.

CHAPTER 10

Line Display

Summary

Properties

<i>Common</i>	<i>Ver</i>	<i>Type</i>	<i>Access</i>	<i>May Use After</i>

StatusUpdateEvent	1.3	Open, Claim, & Enable

General Information

The Line Display Control's OLE programmatic ID is "OPOS.LineDisplay".

Capabilities

The Line Display has the following capability:

- Supports text character display. The default mode (or perhaps only mode) of the display is character display output.

The line display may also have the following additional capabilities:

- Supports windowing with marquee-like scrolling of the window. The display may support vertical or horizontal marquees, or both.
- Supports a waiting period between displaying characters, for a teletype effect.
- Supports character-level or device-level blinking at adjustable blink rates.
- Supports character-level or device-level reverse video.
- Supports one or more descriptors. Descriptors are small indicators with a fixed label, and are typically used to indicate transaction states such as item, total, and change.
- Supports device brightness control, with one or more levels of device dimming. All devices support brightness levels of "normal" and "blank" (at least through software support), but some devices also support one or more levels of dimming.
- Supports various cursor attributes including underline, block, and reverse video.
- Supports "glyphs" which represent pixel level user definition of character cells.

The following capability is not addressed in this version of the OPOS specification:

- Support for graphical displays, where the entire line display is addressable by individual pixels or dots. However, note that glyphs which represent user defined pixels within a character cell are supported.

Model

The general model of a line display:

- Consists of one or more rows containing one or more columns of characters. The characters in the default character set will include at least one of the following, with a capability defining the character set:
 - ◆ The digits ‘0’ through ‘9’ plus space, minus (‘-’), and period (‘.’).
 - ◆ The above set plus uppercase ‘A’ through ‘Z.’
 - ◆ All ASCII characters from 0x20 through 0x7F, which includes space, digits, uppercase, lowercase, and some special characters.
- The rows and columns are numbered beginning with (0, 0) at the upper-left corner of the window.
- Window 0 is always defined as follows:
 - ◆ Its “viewport” — the portion of the display that is updated by the window — covers the entire display.
 - ◆ The size of the window matches the entire display.

Therefore, window 0, which is also called the “device window”, maps directly onto the display.

- Additional windows may be created. A created window has the following characteristics:
 - ◆ Its viewport covers part or all of the display.
 - ◆ The window may either match the size of the viewport, or it may be larger than the viewport in either the horizontal or vertical direction. In the second case, marquee scrolling of the window can be set.
 - ◆ The window maintains its own values for rows and columns, current cursor row and column, cursor update flag, cursor type, scroll type and format, and timers.
 - ◆ All viewports behave transparently. If two viewports overlap, then the last character displayed at a position by either of the windows will be visible.

Display Modes

- **Immediate Mode**

In effect when **MarqueeType** is DISP_MT_NONE and **InterCharacterWait** is zero.

If the window is bigger than the viewport, then only those characters which map into the viewport will be seen.

- **Teletype Mode**

In effect when **MarqueeType** is DISP_MT_NONE and **InterCharacterWait** is not zero.

DisplayText and **DisplayTextAt** requests are enqueued and processed in the order they are received. The **InterCharacterWait** timer specifies the time to wait between outputting each character. **InterCharacterWait** only applies to those characters within the viewport.

- **Marquee Mode**

In effect when **MarqueeType** is not DISP_MT_NONE.

The window must be bigger than the viewport.

A marquee is typically initialized after entering Marquee Init Mode by setting **MarqueeType** to DISP_MT_INIT, then calling **ClearText**, **DisplayText**, and **DisplayTextAt** methods. Then, when **MarqueeType** is changed to an “on” value, Marquee On Mode is entered, and the marquee begins to be displayed in the viewport beginning at the start of the window (or end if the type is right or down).

When the mode is changed from Marquee On Mode to off, the marquee stops in place. A subsequent transition from back to Marquee On Mode continues from the current position.

When the mode is changed from Marquee On Mode to Marquee Init Mode, the marquee stops. Changes may be made to the window, then the window may be returned to Marquee On Mode to restart the marquee with the new data.

It is illegal to use **DisplayText**, **DisplayTextAt**, **ClearText**, **RefreshWindow**, and **ScrollText** unless in Marquee Init Mode or marquees are off.

Device Sharing

The line display is an exclusive-use device. Its device sharing rules are:

- The application must claim the device before enabling it.
- The application must claim and enable the device before accessing some properties or calling methods that update the device.
- See the “Summary” table for precise usage prerequisites.

Properties

BlinkRate Property R/W

Added in Release 1.6

Syntax **LONG BlinkRate;**

Remarks Contains the blink cycle time in milliseconds. A blink cycle is the period of time when text completes an on-off-on cycle during blinking. When setting this property, the display will set its blink rate to the closest supported rate and change the **BlinkRate** property to reflect the actual rate. Performing this approximation is necessary because blink cycles are hardware dependent and probably not controllable at precise millisecond granularity.

This property is initialized by the **Open** method.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	CapBlinkRate is FALSE.
<i>Other Values</i>	See ResultCode .

See Also **CapBlinkRate** Property

CapBlink Property

Syntax **LONG CapBlink;**

Remarks Holds the character blink capability of the device. It may be one of the following:

Value	Meaning
DISP_CB_NOBLINK	Blinking is not supported. Value is 0.
DISP_CB_BLINKALL	Blinking is supported. The entire contents of the display are either blinking or in a steady state.
DISP_CB_BLINKEACH	Blinking is supported. Each character may be individually set to blink or to be in a steady state.

This property is initialized by the **Open** method.

CapBlinkRate Property

Added in Release 1.6

Syntax **BOOL CapBlinkRate;**

Remarks If TRUE, the device's blink rate can be controlled and the **BlinkRate** property is used to indicate the rate at which the display blinks; otherwise it is FALSE.

This property is initialized by the **Open** method.

CapBrightness Property

Syntax **BOOL CapBrightness;**

Remarks If TRUE, the brightness control is supported; otherwise it is FALSE.

This property is initialized by the **Open** method.

CapCharacterSet Property**Updated in Release 1.5**

Syntax **LONG CapCharacterSet;**

Remarks Holds the default character set capability. It may be one of the following:

Value	Meaning
DISP_CCS_NUMERIC	The default character set supports numeric data, plus space, minus, and period.
DISP_CCS_ALPHA	The default character set supports uppercase alphabetic plus numeric, space, minus, and period.
DISP_CCS_ASCII	The default character set supports all ASCII characters between 20-hex and 7F-hex.
DISP_CCS_KANA	The default character set supports partial code page 932, including ASCII characters 20-hex through 7F-hex and the Japanese Kana characters A1-hex through DF-hex, but excluding the Japanese Kanji characters.
DISP_CCS_KANJI	The default character set supports code page 932, including the Shift-JIS Kanji characters, Levels 1 and 2.
DISP_CCS_UNICODE	The default character set supports UNICODE.

The default character set may contain a superset of these ranges. The initial **CharacterSet** property may be examined for additional information.

This property is initialized by the **Open** method.

CapCursorType Property***Added in Release 1.6*****Syntax** **LONG CapCursorType;****Remarks** Holds a Bitwise indication of the cursor types supported by the device and selectable via the **CursorType** property. Following are the values:

Value	Meaning
DISP_CCT_NONE	Cursor is not displayed.
DISP_CCT_FIXED	Cursor is always displayed.
DISP_CCT_BLOCK	Cursor is displayable as a block.
DISP_CCT_HALFBLOCK	Cursor is displayable as a halfblock.
DISP_CCT_UNDERLINE	Cursor is displayable as an underline.
DISP_CCT_REVERSE	Cursor is displayable in reverse video.
DISP_CCT_OTHER	Cursor is displayable but form is unknown.

If DISP_CCT_NONE is set then none of the other bits will be set. This is because the cursor is not displayable.

If DISP_CCT_FIXED is set then one and only one of the other bits will be set. This other bit will indicate the cursor type that is always displayed.

This property is initialized by the **Open** method.

CapCustomGlyph Property***Added in Release 1.6*****Syntax** **BOOL CapCustomGlyph;****Remarks** Holds the glyph definition capability of the device. The value is TRUE if the device allows custom glyphs to be defined, FALSE if not.

This property is initialized by the **Open** method.

CapDescriptors Property

Syntax	BOOL CapDescriptors;
Remarks	If TRUE, then the display supports descriptors; otherwise it is FALSE. This property is initialized by the Open method.

CapHMarquee Property

Syntax	BOOL CapHMarquee;
Remarks	If TRUE, the display supports horizontal marquee windows; otherwise it is FALSE. This property is initialized by the Open method.

CapICharWait Property

Syntax	BOOL CapICharWait;
Remarks	If TRUE, the display supports intercharacter wait; otherwise it is FALSE. This property is initialized by the Open method.

CapReadBack Property***Added in Release 1.6*****Syntax** **LONG CapReadBack;****Remarks** Holds the capability of the video device to read back the data displayed upon it. It may be one of the following:

Value	Meaning
DISP_CRB_NONE	Read back is not supported.
DISP_CRB_SINGLE	Read back of a single character at a time is supported.

This property is initialized by the **Open** method.

CapReverse Property***Added in Release 1.6*****Syntax** **LONG CapReverse;****Remarks** Holds the reverse video capability of the device. It may be one of the following:

Value	Meaning
DISP_CR_NONE	Reverse video is not supported. Value is 0.
DISP_CR_REVERSEALL	Reverse video is supported. The entire contents of the display are either in reverse video or normal.
DISP_CR_REVERSEEACH	Reverse video is supported. Each character may be individually set to reverse video or to normal.

This property is initialized by the **Open** method.

CapVMarquee Property

Syntax **BOOL CapVMarquee;**

Remarks If TRUE, the display supports vertical marquee windows;
otherwise it is FALSE.

This property is initialized by the **Open** method.

CharacterSet Property R/W *Updated in Release 1.5***Syntax** LONG CharacterSet;**Remarks** Contains the character set for displaying characters.

It is one of the following ranges or values:

Value	Meaning
Range 101 - 199	A device-specific character set that does not match a code page, nor the ASCII or Windows ANSI character sets.
Range 400 - 990	Code page; matches one of the standard values.
DISP_CS_UNICODE	The character set supports UNICODE. The value of this constant is 997.
DISP_CS_ASCII	The ASCII character set, supporting the ASCII characters between 20-hex and 7F-hex. The value of this constant is 998.
DISP_CS_WINDOWS	The Windows ANSI character set. The value of this constant is 999. This is exactly equivalent to the Windows code page 1252.
Range 1000 and higher	Windows code page; matches one of the standard values.

This property is initialized to an appropriate value when the device is first enabled following the **Open** method. This value is guaranteed to support at least the set of characters specified by the **CapCharacterSet** capability.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
<i>Other Values</i>	See ResultCode .

See Also CharacterSetList Property; CapCharacterSet Property

CharacterSetList Property

Syntax **BSTR CharacterSetList;**

Remarks A string of character set numbers.

This property is initialized by the **Open** method. The string consists of ASCII numeric set numbers separated by commas.

For example, if the string is “101,850,999”, then the device supports a device-specific character set, code page 850, and the Windows ANSI character set.

See Also **CharacterSet** Property

Columns Property

Syntax **LONG Columns;**

Remarks Holds the number of columns for this window.

For window 0, **Columns** is the same as **DeviceColumns**.

For other windows, it may be less or greater than **DeviceColumns**.

This property is initialized to **DeviceColumns** by the **Open** method, and is updated when **CurrentWindow** is set and when **CreateWindow** or **DestroyWindow** are called.

See Also **Rows** Property

CurrentWindow Property R/W *Updated in Release 1.6***Syntax** **LONG CurrentWindow;****Remarks** Holds the current window to which text is displayed.

Several properties are associated with each window: **Rows**, **Columns**, **CursorRow**, **CursorColumn**, **CursorUpdate**, **CursorType**, **MarqueeFormat**, **MarqueeType**, **MarqueeUnitWait**, **MarqueeRepeatWait**, and **InterCharacterWait**.

When set, this property changes the current window and sets the associated properties to their values for this window.

Setting a window does not refresh its viewport. If this window and another window's viewports overlap, and the other window has changed the viewport, then **RefreshWindow** may be called to restore this window's viewport contents.

This property is initialized to zero – the device window – by the **Open** method, and is updated when **CreateWindow** or **DestroyWindow** are called.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The new current window was set successfully.
OPOS_E_ILLEGAL	The new current window value is not valid.

CursorColumn Property R/W

Syntax **LONG CursorColumn;**

Remarks Holds the column in the current window to which the next displayed character will be output.

Legal values range from (zero) through (**Columns**). (See **DisplayText** for a note on the interpretation of **CursorColumn = Columns**.)

This property is initialized to zero on the by the **Open** and **CreateWindow** methods, and is updated when **CurrentWindow** is set or **ClearText**, **DisplayTextAt**, or **DestroyWindow** is called. It is also updated when **DisplayText** is called if **CursorUpdate** is TRUE.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The cursor column was set successfully.
OPOS_E_ILLEGAL	An invalid cursor column value was used.

See Also **CursorRow** Property; **DisplayText** Method

CursorRow Property R/W

Syntax **LONG CursorRow;**

Remarks Holds the row in the current window to which the next displayed character will be output.

Legal values range from (zero) through (**Rows** - 1).

This property is initialized to zero by the **Open** and **CreateWindow** methods, and is updated when **CurrentWindow** is set or **ClearText**, **DisplayTextAt**, or **DestroyWindow** is called. It is also updated when **DisplayText** is called if **CursorUpdate** is TRUE.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The cursor row was set successfully.
OPOS_E_ILLEGAL	An invalid cursor row value was used.

See Also **CursorColumn** Property; **DisplayText** Method

CursorType Property R/W *Added in Release 1.6*

Syntax **LONG CursorType;**

Remarks Holds the cursor type for the current window. Following are the possible values:

Value	Meaning
DISP_CT_NONE	Cursor is not displayed.
DISP_CT_BLOCK	Cursor is displayed as a block.
DISP_CT_HALFBLOCK	Cursor is displayed as a halfblock.
DISP_CT_UNDERLINE	Cursor is displayed as an underline.
DISP_CT_REVERSE	Cursor is displayed in reverse video.
DISP_CT_OTHER	Cursor is displayed but form is unknown.

This property cannot be written if **CapCursorType** has either the DISP_CCT_NONE or DISP_CCT_FIXED bits on. Otherwise, it can be set to one of the cursor types specified by **CapCursorType**.

This property is maintained for each window. Setting this property affects only the current window since only the current window has a displayable cursor.

This property is initialized to DISP_CT_NONE (or the appropriate value if **CapCursorType** had DISP_CCT_FIXED set) by the **Open** and **CreateWindow** methods, and is updated when **CurrentWindow** is set or **DestroyWindow** is called.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	CapCursorType is either DISP_CCT_NONE or DISP_CCT_FIXED, or an invalid cursor type value was specified.

See Also **CapCursorType** Property

CursorUpdate Property R/W

Syntax	BOOL CursorUpdate;				
Remarks	<p>If TRUE when characters are displayed by the DisplayText or DisplayTextAt method, CursorRow and CursorColumn will be updated to point to the character beyond the last character output.</p> <p>If FALSE when characters are displayed, then the cursor properties will not be updated.</p> <p>This property is maintained for each window. It initialized to TRUE by the Open and CreateWindow methods, and is updated when CurrentWindow is set or DestroyWindow is called.</p>				
Return	When this property is set, the following value is placed in the ResultCode property:				
	<table> <tr> <th>Value</th><th>Meaning</th></tr> <tr> <td>OPOS_SUCCESS</td><td>The property was set successfully.</td></tr> </table>	Value	Meaning	OPOS_SUCCESS	The property was set successfully.
Value	Meaning				
OPOS_SUCCESS	The property was set successfully.				
See Also	CursorRow Property; CursorColumn Property				

CustomGlyphList Property *Added in Release 1.6*

Syntax	BSTR CustomGlyphList;
Remarks	<p>Character codes available for definition as glyphs. Character codes are represented as two-digit (ASCII) or four-digit (Unicode) hexadecimal values. These values are comma separated and each value may actually represent a range of characters specified by using the '-' character.</p> <p>This property is initialized by the Open method.</p> <p>For example, if the string is "2D,4D", then the device supports glyph definitions for the characters "–" and "M", respectively. As well, the string "002D-004D" would specify that the device supports glyph definitions for all the Unicode characters between 002D and 004D, inclusive. Also, if the string is "2D-2F, 3D-3F" then the device supports glyph definitions for the range of hex characters 2D through 2F and 3D through 3F.</p>
See Also	CapCustomGlyph Property; GlyphWidth Property; GlyphHeight Property; DefineGlyph Method

DeviceBrightness Property R/W

Syntax **LONG DeviceBrightness;**

Remarks Holds the device brightness value, expressed as a percentage between 0 and 100.

Any device can support 0% (blank) and 100% (full intensity). Blanking can, at a minimum, be supported by sending spaces to the device. If the capability **CapBrightness** is TRUE, then the device also supports one or more levels of dimming.

If a device does not support the specified brightness value, then the Service Object will choose an appropriate substitute.

This property is initialized to 100 when the device is first enabled following the **Open** method.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An invalid property value was used: Not in the range 0 through 100.

DeviceColumns Property

Syntax **LONG DeviceColumns;**

Remarks Holds the number of columns on this device.

This property is initialized by the **Open** method.

See Also **DeviceRows** Property

DeviceDescriptors Property

Syntax	LONG DeviceDescriptors;
Remarks	<p>Holds the number of descriptors on this device.</p> <p>If the capability CapDescriptors is TRUE, then DeviceDescriptors is non-zero; otherwise it is zero.</p> <p>This property is initialized by the Open method.</p>
See Also	SetDescriptor Method; ClearDescriptors Method

DeviceRows Property

Syntax	LONG DeviceRows;
Remarks	<p>Holds the number of rows on this device.</p> <p>This property is initialized by the Open method.</p>
See Also	DeviceColumns Property

DeviceWindows Property

Syntax	LONG DeviceWindows;
Remarks	<p>Holds the maximum window number supported by this device. A value of zero indicates that only the device window is supported, and that no windows may be created.</p> <p>This property is initialized by the Open method.</p>
See Also	CurrentWindow Property

GlyphHeight Property***Added in Release 1.6***

- Syntax** **LONG GlyphHeight;**
- Remarks** Indicates the glyph height based on number of pixels for a character cell.
This property is initialized by the **Open** method.
- See Also** **CapCustomGlyph** Property; **CustomGlyphList** Property; **DefineGlyph** Method

GlyphWidth Property***Added in Release 1.6***

- Syntax** **LONG GlyphWidth;**
- Remarks** Indicates the glyph width based on number of pixels for a character cell.
This property is initialized by the **Open** method.
- See Also** **CapCustomGlyph** Property; **CustomGlyphList** Property; **DefineGlyph** Method

InterCharacterWait Property R/W

Syntax **LONG InterCharacterWait;**

Remarks Holds the wait time between displaying each character with the **DisplayText** and **DisplayTextAt** methods. This timer gives a “teletype” appearance when displaying the text.

InterCharacterWait is only used if the window is not in Marquee Mode — that is, **MarqueeType** must be **DISP_MT_NONE**.

When non-zero and the window is not in Marquee Mode, the window is in Teletype Mode: **DisplayText** and **DisplayTextAt** requests are enqueued and processed in the order they are received. The **InterCharacterWait** timer specifies the time to wait between outputting each character into the viewport. The wait time is the specified number of milliseconds. (Note that the system timer resolution may reduce the precision of the wait time.) If **CursorUpdate** is **TRUE**, **CursorRow** and **CursorColumn** are updated to their final values before **DisplayText** or **DisplayTextAt** returns, even though all of its data may not yet be displayed.

When the timer is zero and the window is not in Marquee Mode, Immediate Mode is in effect, so that characters are processed as quickly as possible. If some display requests are enqueued at the time that **InterCharacterWait** is set to zero, the requests are completed as quickly as possible.

If the capability **CapICharWait** is **FALSE**, then intercharacter wait is not supported, and the value of this property is not used.

This property is initialized to zero by the **Open** and **CreateWindow** methods, and is updated when **CurrentWindow** is set or **DestroyWindow** is called.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An illegal value was specified.

See Also **DisplayText** Method

MarqueeFormat Property R/W

Syntax **LONG MarqueeFormat;**

Remarks Holds the marquee format for the current window.

Value	Meaning
DISP_MF_WALK	Begin the marquee by walking data from the opposite side. For example, if the marquee type is “left”, then the viewport is filled by bringing characters into the right side and scrolling them to the left.
DISP_MF_PLACE	Begin the marquee by placing data. For example, if the marquee type is “left”, then the viewport is filled by placing characters starting at the left side, and beginning scrolling only after the viewport is full.

The value of **MarqueeFormat** is initialized to DISP_MF_WALK by the **Open** and **CreateWindow** methods, and is updated when **CurrentWindow** is set or **DestroyWindow** is called.

MarqueeFormat is read when a transition is made to Marquee On Mode. It is not used when not in Marquee Mode.

When **MarqueeFormat** is DISP_MF_WALK, and a transition is made from Marquee Init Mode to Marquee On Mode, the following occurs:

1. Map the window to the viewport as follows:

<u>Marquee Type</u>	<u>Window</u>		<u>Viewport</u>
Left	First Column	=	Last Column
Up	First Row	=	Last Row
Right	Last Column	=	First Column
Down	Last Row	=	First Row

Fill the viewport with blanks. Continue to Step 2 without waiting.

2. Display the mapped portion of the window into the viewport, then wait **MarqueeUnitWait** milliseconds. Move the window mapping onto the viewport by one row or column in the marquee direction. Repeat until the viewport is full.
3. Refresh the viewport, then wait **MarqueeUnitWait** milliseconds. Move the window mapping by one row or column. Repeat until the last row or column is scrolled into the viewport (in which case, omit the unit wait).
4. Wait **MarqueeRepeatWait** milliseconds. Then go to step back to Step 1.

When **MarqueeFormat** is DISP_MF_PLACE, and a transition is made from Marquee Init Mode to Marquee On Mode, the following occurs:

1. Map the window to the viewport as follows:

<u>Marquee Type</u>	<u>Window</u>	<u>Viewport</u>
Left	First Column	= First Column
Up	First Row	= First Row
Right	Last Column	= Last Column
Down	Last Row	= Last Row

Fill the viewport with blanks. Continue to Step 2 without waiting.

2. Display a row or column into viewport, then wait **MarqueeUnitWait** milliseconds. Repeat until the viewport is full.
3. Move the window mapping onto the viewport by one row or column in the marquee direction, and refresh the viewport, then wait **MarqueeUnitWait** milliseconds. Repeat until the last row or column is scrolled into the viewport (in which case, omit the unit wait).
4. Wait **MarqueeRepeatWait** milliseconds. Then go to step back to Step 1.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

<u>Value</u>	<u>Meaning</u>
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An invalid property value was used, or attempted to change window 0.

See Also **MarqueeType** Property; **MarqueeUnitWait** Property; **MarqueeRepeatWait** Property

Example 1 Marquee Walk format.

- Assume a 2x20 display.
- A Visual Basic application has a line display object named LD.
- The application has performed:
LD.CreateWindow(0, 3, 2, 3, 2, 5) ' 2x3 viewport of 2x5 window
LD.DisplayText("0123456789", DISP_DT_NORMAL)

The window contains:

	0	1	2	3	4
0	0	1	2	3	4
1	5	6	7	8	9

and the display contains (assuming the other windows are all blank):

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
0				0	1	2														
1				5	6	7														

If the application performs the sequence:

LD.MarqueeType = DISP_MT_INIT

LD.MarqueeFormat = DISP_MF_WALK

LD.DisplayTextAt(0, 4, "AB", DISP_DT_NORMAL)

the viewport is not changed (since we are in Marquee Init Mode), and the window becomes:

	0	1	2	3	4
0	0	1	2	3	A
1	B	6	7	8	9

If the application performs:

LD.MarqueeType = DISP_MT_LEFT

the window is not changed, and the viewport becomes:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
0						0														
1						B														

After **MarqueeUnitWait** milliseconds, the viewport is changed to:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
0					0	1														
1					B	6														

After **MarqueeUnitWait** milliseconds, the viewport is changed to:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
0				0	1	2														
1				B	6	7														

After **MarqueeUnitWait** milliseconds, the viewport is changed to:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
0				1	2	3														
1				6	7	8														

After **MarqueeUnitWait** milliseconds, the viewport is changed to:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
0				2	3	A														
1				7	8	9														

The marquee has scrolled to the end of the window.

After **MarqueeRepeatWait** milliseconds, the marquee display restarts with the viewport changing to:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
0						0														
1						B														

Example 2 Marquee Place format.

- Assume a 2x20 display.
- A Visual Basic application has a line display object named LD.
- The application has performed:
 - LD.CreateWindow(0, 3, 2, 3, 2, 5) ' 2x3 viewport of 2x5 window
 - LD.DisplayText("0123456789", DISP_DT_NORMAL)

The window contains:

	0	1	2	3	4
0	0	1	2	3	4
1	5	6	7	8	9

and display contains (assuming the other windows are all blank):

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
0				0	1	2														
1				5	6	7														

If the application performs the sequence:

```
LD.MarqueeType = DISP_MT_INIT
LD.MarqueeFormat = DISP_MF_PLACE
LD.DisplayTextAt(0, 4, "AB", DISP_DT_NORMAL)
```

the viewport is not changed (since we are in Marquee Init Mode), and the window becomes:

	0	1	2	3	4
0	0	1	2	3	A
1	B	6	7	8	9

If the application performs:

LD.MarqueeType = DISP_MT_LEFT

the window is not changed, and the viewport becomes:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
0				0																
1				B																

After **MarqueeUnitWait** milliseconds, the viewport is changed to:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
0				0	1															
1				B	6															

After **MarqueeUnitWait** milliseconds, the viewport is changed to:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
0				0	1	2														
1				B	6	7														

From this point to the end of the window, the marquee action is the same as with marquee walking...

After **MarqueeUnitWait** milliseconds, the viewport is changed to:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
0				1	2	3														
1				6	7	8														

After **MarqueeUnitWait** milliseconds, the viewport is changed to:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
0				2	3	A														
1				7	8	9														

The marquee has scrolled to the end of the window.

After **MarqueeRepeatWait** milliseconds, the marquee display restarts with the viewport changing to:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
0				0																
1				B																

MarqueeRepeatWait Property R/W

Syntax **LONG MarqueeRepeatWait;**

Remarks Holds the wait time between scrolling the final character or row of the window into its viewport and restarting the marquee with the first or last character or row.

The wait time is the specified number of milliseconds. (Note that the timer resolution may reduce the precision of the wait time.)

This property is initialized to zero by the **Open** and **CreateWindow** methods, and is updated when **CurrentWindow** is set or **DestroyWindow** is called.

MarqueeRepeatWait is not used if not in Marquee Mode.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An illegal value was specified.

See Also **MarqueeType** Property; **MarqueeFormat** Property; **MarqueeUnitWait** Property

MarqueeType Property R/W

Syntax **LONG MarqueeType;**

Remarks Holds the marquee type for the current window. When not DISP_MT_NONE, the window is in Marquee Mode.

Value	Meaning
DISP_MT_NONE	Marquees are disabled for this window.
DISP_MT_INIT	Marquee Init Mode. Changes to the window are not reflected in the viewport until MarqueeType is changed to another value.
DISP_MT_UP	Scroll the window up. Illegal unless Rows is greater than the <i>Height</i> parameter used for the window's CreateWindow call, and the capability CapVMarquee is TRUE.
DISP_MT_DOWN	Scroll the window down. Illegal unless Rows is greater than the <i>Height</i> parameter used for the window's CreateWindow call, and the capability CapVMarquee is TRUE.
DISP_MT_LEFT	Scroll the window left. Illegal unless Columns is greater than the <i>Width</i> parameter used for the window's CreateWindow call, and the capability CapHMarquee is TRUE.
DISP_MT_RIGHT	Scroll the window right. Illegal unless Columns is greater than the <i>Width</i> parameter used for the window's CreateWindow call, and the capability CapHMarquee is TRUE.

A marquee is typically initialized after entering Marquee Init Mode by setting **MarqueeType** to DISP_MT_INIT, then calling **ClearText** and **DisplayText(At)** methods. Then, when **MarqueeType** is changed to an “on” value, Marquee On Mode is entered, and the marquee begins to be displayed in the viewport beginning at the start of the window (or end if the type is right or down).

When the mode is changed from Marquee On Mode to off, the marquee stops in place. A subsequent transition from back to Marquee On Mode continues from the current position.

When the mode is changed from Marquee On Mode to Marquee Init Mode, the marquee stops. Changes may be made to the window, then the window may be returned to Marquee On Mode to restart the marquee with the new data.

MarqueeType is always DISP_MT_NONE for window 0 – the device window.

The value of **MarqueeType** is initialized to DISP_MT_NONE by the **Open** and **CreateWindow** methods, and is updated when **CurrentWindow** is set or **DestroyWindow** is called.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An invalid property value was used, or attempted to change window 0.

See Also **MarqueeFormat** Property; **MarqueeUnitWait** Property; **MarqueeRepeatWait** Property

MarqueeUnitWait Property R/W

Syntax	LONG MarqueeUnitWait;						
Remarks	<p>Holds the wait time between marquee scrolling of each column or row in the window.</p> <p>The wait time is the specified number of milliseconds. (Note that the timer resolution may reduce the precision of the wait time.)</p> <p>MarqueeUnitWait is not used if MarqueeType is DISP_MT_NONE.</p> <p>This property is initialized to zero by the Open and CreateWindow methods, and is updated when CurrentWindow is set or DestroyWindow is called.</p>						
Return	<p>When this property is set, the following value is placed in the ResultCode property:</p> <table> <tr> <th>Value</th><th>Meaning</th></tr> <tr> <td>OPOS_SUCCESS</td><td>The property was set successfully.</td></tr> <tr> <td>OPOS_E_ILLEGAL</td><td>An illegal value was specified.</td></tr> </table>	Value	Meaning	OPOS_SUCCESS	The property was set successfully.	OPOS_E_ILLEGAL	An illegal value was specified.
Value	Meaning						
OPOS_SUCCESS	The property was set successfully.						
OPOS_E_ILLEGAL	An illegal value was specified.						
See Also	MarqueeType Property; MarqueeFormat Property; MarqueeRepeatWait Property						

Rows Property

Syntax	LONG Rows;
Remarks	<p>Holds the number of rows for this window.</p> <p>For window 0, Rows is the same as DeviceRows.</p> <p>For other windows, it may be less or greater than DeviceRows.</p> <p>This property is initialized to DeviceRows by the Open method, and is updated when CurrentWindow is set or CreateWindow or DestroyWindow are called.</p>
See Also	Columns Property

Methods

ClearDescriptors Method

Syntax **LONG ClearDescriptors ();**

Remarks Turns off all descriptors.

This function is illegal if the capability **CapDescriptors** is FALSE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	The device does not support descriptors.
<i>Other Values</i>	See ResultCode .

See Also **SetDescriptor** Method; **DeviceDescriptors** Property

ClearText Method

Syntax **LONG ClearText ();**

Remarks Clears the current window to blanks, sets **CursorRow** and **CursorColumn** to zero, and resynchronizes the beginning of the window with the start of the viewport.

If in Immediate Mode or Teletype Mode, the viewport is also cleared immediately.

If in Marquee Init Mode, the viewport is not changed.

If in Marquee On Mode, **ClearText** is illegal.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	In Marquee On Mode.
<i>Other Values</i>	See ResultCode .

See Also **DisplayText** Method

CreateWindow Method**Updated in Release 1.6**

Syntax **LONG CreateWindow** (**LONG** *ViewportRow*, **LONG** *ViewportColumn*,
LONG *ViewportHeight*, **LONG** *ViewportWidth*,
LONG *WindowHeight*, **LONG** *WindowWidth*);

Parameter	Description
<i>ViewportRow</i>	The viewport's start device row.
<i>ViewportColumn</i>	The viewport's start device column.
<i>ViewportHeight</i>	The number of device rows in the viewport.
<i>ViewportWidth</i>	The number of device columns in the viewport.
<i>WindowHeight</i>	The number of rows in the window.
<i>WindowWidth</i>	The number of columns in the window.

Remarks Creates a viewport over the portion of the display given by the first four parameters. The window size is given by the last two parameters. Valid window row values range from (0) to (*WindowHeight*-1) and column values range from (0) to (*WindowWidth*-1).

The window size must be at least as large as the viewport size.

The window size may be larger than the viewport size in one direction. Using the window marquee properties **MarqueeType**, **MarqueeFormat**, **MarqueeUnitWait**, and **MarqueeRepeatWait**, such a window may be continuously scrolled in a marquee fashion.

When successful, **CreateWindow** sets the **CurrentWindow** property to the window number assigned to this window. The following properties are maintained for each window, and are initialized as given:

Property	Value
Rows	Set to <i>WindowHeight</i> .
Columns	Set to <i>WindowWidth</i> .
CursorRow	Set to 0.
CursorColumn	Set to 0.
CursorType	Set to DISP_CT_NONE (or the appropriate value if CapCursorType has DISP_CCT_FIXED set).
CursorUpdate	Set to TRUE.

MarqueeType Set to DISP_MT_NONE.

MarqueeFormat Set to DISP_MF_WALK.

MarqueeUnitWait Set to 0.

MarqueeRepeatWait Set to 0.

InterCharacterWait Set to 0.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One or more parameters are out of their valid ranges, or all available windows are already in use.
<i>Other Values</i>	See ResultCode .

See Also **DestroyWindow** Method; **CurrentWindow** Property

DefineGlyph Method***Added in Release 1.6*****Syntax** **LONG DefineGlyph (LONG *GlyphCode*, BSTR *Glyph*);**

Parameter	Description
<i>GlyphCode</i>	The character code to be defined.
<i>Glyph</i>	Data bytes that define the glyph. The format of this data depends upon the value of the BinaryConversion property. See page 39.

Remarks Defines a glyph character.

The glyph is defined as bits representing each pixel packed into bytes using whole bytes to represent each row.

The minimum number of bytes are sent for each row, based on **GlyphWidth** and using 8 bits per byte. Bytes are sent left-to-right across each row; if more than one byte is required per row, the leftmost byte is sent first. The lowest-order bit within a byte represents the rightmost pixel. Bits that do not represent pixels are the highest order bits and their value is ignored. Rows are sent from the top down.

A 10 pixel wide glyph would have the two leftmost pixels represented in bits 1 and 0 of the first byte, respectively. The remaining 8 pixels would be represented in the second byte.

Enough rows must be sent to define the entire character. Whether changing the definition of a glyph causes currently displayed characters to change, or the change appears only when next drawn, is hardware-defined.

Example: A 5 column 7 row character cell –

Bit Position 76543210	Byte	Hex Value
. * . . .	0	08
. . * . .	1	04
* . . * .	2	12
. * . . *	3	09
. . * . .	4	04
. . . * .	5	02
. . . . *	6	01

Example: A 12 column by 16 row character cell –

Bit Position	Bytes	Hex Values
111111 5432109876543210		
.....	0,1	00 00
.....*	2,3	00 40
....***	4,5	00 E0
...**.*	6,7	01 B0
..**...*	8,9	03 18
..**...*	10,11	03 18
..*****	12,13	03 F8
..*****	14,15	03 F8
..**...*	16,17	03 18
..**...*	18,19	03 18
..**...*	20,21	03 18
.....	22,23	00 00
.....	24,25	00 00
.....	26,27	00 00
.....	28,29	00 00
.....	30,31	00 00

This method is illegal if **CapCustomGlyph** is FALSE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	CapCustomGlyph is FALSE, or <i>GlyphCode</i> is an unsupported character code for glyph definition.
<i>Other Values</i>	See ResultCode .

See Also **CapCustomGlyph** Property; **CustomGlyphList** Property; **GlyphWidth** Property; **GlyphHeight** Property

DestroyWindow Method

Syntax **LONG DestroyWindow ();**

Remarks Destroys the current window. The characters displayed in its viewport are not changed.

CurrentWindow is set to window 0. The device window and the associated window properties are updated.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	The current window is 0. This window may not be destroyed.
<i>Other Values</i>	See ResultCode .

See Also **CreateWindow** Method; **CurrentWindow** Property

DisplayText Method**Updated in Release 1.6****Syntax** **LONG DisplayText (BSTR *Data*, LONG *Attribute*);**

Parameter	Description
<i>Data</i>	The string of characters to display. The format of this data depends upon the value of the BinaryConversion property. See page 39.
<i>Attribute</i>	The display attribute for the text. Must be either DISP_DT_NORMAL, DISP_DT_BLINK, DISP_DT_REVERSE or DISP_DT_BLINK_REVERSE.

Remarks The characters in *Data* are processed beginning at the location specified by **CursorRow** and **CursorColumn**, and continue in succeeding columns.

Character processing continues to the next row when the end of a window row is reached. If the end of the window is reached with additional characters to be processed, then the window is scrolled upward by one row and the bottom row is set to blanks. If **CursorUpdate** is TRUE, then **CursorRow** and **CursorColumn** are updated to point to the character following the last character of *Data*.

Note

Scrolling will not occur when the last character of *Data* is placed at the end of a row. In this case, when **CursorUpdate** is TRUE, then **CursorRow** is set to the row containing the last character, and **CursorColumn** is set to **Columns** (that is, to one more than the final character of the row).

This stipulation ensures that the display does not scroll when a character is written into its last position. Instead, the Control will wait until another character is written before scrolling the window.

The operation of **DisplayText** (and **DisplayTextAt**) varies for each mode:

- Immediate Mode (**MarqueeType** = DISP_MT_NONE and **InterCharacterWait** = 0): Updates the window and viewport immediately.
- Teletype Mode (**MarqueeType** = DISP_MT_NONE and **InterCharacterWait** not = 0): The *Data* is enqueued. Enqueued data requests are processed in order (typically by another thread within the Control), updating the window and viewport using a wait of **InterCharacterWait** milliseconds after each character is sent to the viewport.
- Marquee Init Mode (**MarqueeType** = DISP_MT_INIT): Updates the window, but does not change the viewport.
- Marquee On Mode (**MarqueeType** not = DISP_MT_INIT): Illegal.

If the capability **CapBlink** is DISP_CB_NOBLINK, then *Attribute* value DISP_DT_BLINK is ignored and *Attribute* DISP_DT_BLINK_REVERSE is treated as DISP_DT_REVERSE. If it is DISP_CB_BLINKALL, then the entire display will blink when one or more characters have been set to blink. If it is DISP_CB_BLINKEACH, then only those characters displayed with the blink attribute will blink.

If the capability **CapReverse** is DISP_CR_NONE, then *Attribute* value DISP_DT_REVERSE is ignored and *Attribute* DISP_DT_BLINK_REVERSE is treated as DISP_DT_BLINK. If it is DISP_CR_REVERSEALL, then the entire display will be displayed in inverse video when one or more characters have been set to reverse. If it is DISP_CR_REVERSEEACH, then only those characters displayed with the reverse attribute will be displayed in inverse video.

Special character values within *Data* are:

Value	Meaning
Carriage Return (13 Decimal)	Change the next character's output position to the beginning of the current row.
Newline / Line Feed (10 Decimal)	Change the next character's output position to the beginning of the next row. Scroll the window if the current row is the last row of the window.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	<i>Attribute</i> is illegal, or the display is in Marquee On Mode.
<i>Other Values</i>	See ResultCode .

See Also **DisplayTextAt** Method; **ClearText** Method; **CapBlink** Property; **CapReverse** Property; **InterCharacterWait** Property

DisplayTextAt Method**Updated in Release 1.6**

Syntax **LONG DisplayTextAt (LONG Row, LONG Column, BSTR Data, LONG Attribute);**

Parameter	Description
<i>Row</i>	The start row for the text.
<i>Column</i>	The start column for the text.
<i>Data</i>	The string of characters to display. The format of this data depends upon the value of the BinaryConversion property. See page 39.
<i>Attribute</i>	The display attribute for the text. Must be either DISP_DT_NORMAL, DISP_DT_BLINK, DISP_DT_REVERSE or DISP_DT_BLINK_REVERSE.

Remarks The characters in *Data* are processed beginning at the window location specified by the *Row* and *Column* parameters, and continuing in succeeding columns.

This method has the same effect as setting the **CursorRow** to *Row*, setting **CursorColumn** to *Column*, and calling the **DisplayText** method.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	<i>Row</i> or <i>Column</i> are out of range, <i>Attribute</i> is illegal, or in Marquee On Mode.
<i>Other Values</i>	See ResultCode .

See Also **DisplayText** Method; **ClearText** Method; **CapBlink** Property; **CapReverse** Property; **InterCharacterWait** Property

ReadCharacterAtCursor Method *Added in Release 1.6*

Syntax **LONG ReadCharacterAtCursor(LONG* *pChar*);**

Parameter	Description
------------------	--------------------

<i>pChar</i>	The character read from the display.
--------------	--------------------------------------

Remarks Reads the currently displayed character at the cursor position.

This function is illegal if the capability **CapReadBack** is DISP_CRB_NONE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
--------------	----------------

OPOS_SUCCESS	The method was successful.
--------------	----------------------------

OPOS_E_ILLEGAL	The device does not support character read back.
----------------	--

<i>Other Values</i>	See ResultCode .
---------------------	-------------------------

See Also **CapReadBack** Property

RefreshWindow Method

Syntax **LONG RefreshWindow (LONG *Window*);**

The *Window* parameter specifies which window must be refreshed.

Remarks Changes the current window to *Window*, then redisplay its viewport. Neither the mapping of the window to its viewport nor the window's cursor position is changed.

This function may be used to restore a window after another window has overwritten some of its viewport.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	<i>Window</i> is larger than DeviceWindows or has not been created, or in Marquee On Mode.
<i>Other Values</i>	See ResultCode .

ScrollText Method

Syntax **LONG ScrollText (LONG *Direction*, LONG *Units*);**

The *Direction* parameter indicates the scrolling direction, which may be one of the following:

Value	Meaning
DISP_ST_UP	Scroll the window up.
DISP_ST_DOWN	Scroll the window down.
DISP_ST_LEFT	Scroll the window left.
DISP_ST_RIGHT	Scroll the window right.

The *Units* parameter indicates the number of columns or rows to scroll.

Remarks Scroll the current window.

ScrollText is only legal in Immediate Mode.

If the window size for the scroll direction matches its viewport size, then the window data is scrolled, the last *Units* rows or columns are set to spaces, and the viewport is updated.

If the window size for the scroll direction is larger than its viewport, then the window data is not changed. Instead, the mapping of the window into the viewport is moved in the specified direction. The window data is not altered, but the viewport is updated. If scrolling by *Units* would go beyond the beginning of the window data, then the window is scrolled so that the first viewport row or column contains the first window row or column. If scrolling by *Units* would go beyond the end of the window data, then the window is scrolled so that the last viewport row or column contains the last window row or column.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	<i>Direction</i> is illegal, or in Teletype Mode or Marquee Mode.
<i>Other Values</i>	See ResultCode .

See Also **DisplayText** Method

- Example 1**
- Assume a 2x20 display.
 - A Visual Basic application has a line display object named LD.
 - The application has performed:
 - LD.CreateWindow(0, 3, 2, 4, 2, 4) ' 2x4 viewport of 2x4 window
 - LD.DisplayText("abcdABCD", DISP_DT_NORMAL)

The window contains:

	0	1	2	3
0	a	b	c	d
1	A	B	C	D

and the viewport on the display is:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
0				a	b	c	d													
1				A	B	C	D													

If the method

LD.ScrollText (DISP_ST_LEFT, 2)

is called, the window data becomes:

	0	1	2	3
0	c	d		
1	C	D		

and the viewport becomes:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
0				c	d															
1				C	D															

- Example 2**
- Assume a 2x20 display.
 - A Visual Basic application has a line display object named LD.
 - The application has performed:
 - LD.CreateWindow(0, 3, 2, 4, 2, 8) ' 2x4 viewport of 2x8 window
 - LD.DisplayText("abcdefghABCDEF", DISP_DT_NORMAL)

The window contains:

	0	1	2	3	4	5	6	7
0	a	b	c	d	e	f	g	h
1	A	B	C	D	E	F	G	H

and the viewport on the display is:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
0				a	b	c	d													
1				A	B	C	D													

If the method

LD.ScrollText (DISP_ST_LEFT, 2)

is called, the window data is unchanged, and the viewport becomes:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
0				c	d	e	f													
1				C	D	E	F													

If the method

LD.ScrollText (DISP_ST_UP, 1)

is called next, the window data becomes:

	0	1	2	3	4	5	6	7
0	A	B	C	D	E	F	G	H
1								

and the viewport becomes:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
0				C	D	E	F													
1																				

SetDescriptor Method

Syntax **LONG SetDescriptor (LONG *Descriptor*, LONG *Attribute*);**

The *Descriptor* parameter indicates which descriptor to change. The value may range between zero and one less than **DeviceDescriptors**.

The *Attribute* parameter indicates the attribute for the descriptor. Values are:

Value	Meaning
DISP_SD_ON	Turns the descriptor on.
DISP_SD_BLINK	Sets the descriptor to blinking.
DISP_SD_OFF	Turns the descriptor off.

Remarks Sets the state of one of the descriptors, which are small indicators with a fixed label.

This function is illegal if the capability **CapDescriptors** is FALSE.

The device and its Service Object determine the mapping of *Descriptor* to its descriptors.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	The device does not support descriptors, or one of the parameters contained an illegal value.
<i>Other Values</i>	See ResultCode .

See Also **ClearDescriptors** Method; **DeviceDescriptors** Property

General Information

The MICR Control's OLE programmatic ID is "OPOS.MICR".

Capabilities

The MICR Control has the following minimal set of capabilities:

- Reads magnetic ink characters from a check.
- Has programmatic control of check insertion, reading, and removal. For some MICR devices, this will require no processing in the Control since the device may automate many of these functions.
- Parses the MICR data into the output properties provided by this Control. This release of OPOS specifies parsing of fields specified in the ANSI MICR standard used in North America. For other countries, the application may need to parse the MICR data from the data in **RawData**.

The MICR may have the following additional capability:

- The MICR device may be physically attached to or incorporated into a check validation print device. If this is the case, once a check is inserted via MICR Control methods, the check can still be used by the Printer Control prior to check removal.

Some MICR devices support exception tables, which cause non-standard parsing of the serial number for specific check routing numbers. Exception tables are not directly supported by this OPOS release. However, a Service Object may choose to support them, and could assign registry entries under its device name key to define the exception entries. (See the appendix "APPENDIX B OPOS Registry Usage", page 869.)

This release of OPOS does not define any parsing of partial MICR check data if an error occurs while reading a check.. This is done intentionally since any Service Object that implements such functionality cannot guarantee that fields parsed from partial data are correct. For example, it is possible to get MICR data that contains no '?' characters, but fails its checksum. This would indicate that one or more characters in the data are incorrect, but there is no way to determine which characters they are. If an application wishes to try to parse the partial data itself, the **RawData** property is filled in with whatever was successfully read even in error cases.

Model

The MICR Control follows the general “Input Model” (page 24). One point of difference is that the MICR Control requires the execution of methods to insert and remove the check for processing. Therefore, this Control requires more than simply setting the **DataEventEnabled** property to TRUE in order to receive data. The basic model is as follows:

- The MICR Control is opened, claimed, and enabled.
- When an application wishes to perform a MICR read, the application calls the **BeginInsertion** method, specifying a timeout value. This results in the device being made ready to have a check inserted. The method either returns a success status if the check is inserted before the timeout limit was expired, or a timeout status is returned.

In the event of a timeout, the MICR device will remain in a state allowing a check to be inserted while the application provides any additional prompting required and then reissues the **BeginInsertion** method.

- Once a check is inserted, the method returns successfully and the application calls the **EndInsertion** method, which results in the MICR device being taken out of check insertion mode and the check, if present, actually being read.
 - ◆ If the check is successfully read by the Control, it enqueues a **DataEvent**.
 - ◆ If the **AutoDisable** property is TRUE, then the control automatically disables itself when a **DataEvent** is enqueued.
 - ◆ An enqueued **DataEvent** can be delivered to the application when the **DataEventEnabled** property is TRUE. Just before delivering this event, the Control copies the data into properties, and disables further data events by setting the **DataEventEnabled** property to FALSE. This causes subsequent input data to be enqueued by the Control while the application processes the current input and associated properties. When the application has finished the current input and is ready for more data, it reenables events by setting **DataEventEnabled** to TRUE.
 - ◆ An **ErrorEvent** (or events) are enqueued if the Control encounters an error while reading the check, and is delivered to the application when the **DataEventEnabled** property is TRUE.
 - ◆ The **DataCount** property may be read to obtain the number of **DataEvents** enqueued by the Control.
 - ◆ All input enqueued by the Control may be deleted by calling the **ClearInput** method.
- After processing a **DataEvent**, the application should query the **CapValidationDevice** property to determine if validation printing can be

performed on the check prior to check removal. If this property is true, the application may call the Printer Control's **BeginInsertion** and **EndInsertion** methods. This positions the check for validation printing. The Printer Control's validation printing methods can then be used to perform validation printing. When validation printing is complete, the application should call the Printer Control's removal methods to remove the check.

- Once the check is no longer needed in the device, the application must call the **BeginRemoval** method, also specifying a timeout value. This method either returns a success status if the check is removed, or timeout if the check is not removed. If a timeout is returned, the application may perform any additional prompting prior to calling the method again. Once the check is removed, the application should call the **EndRemoval** method to take the MICR device out of removal mode.
-

Many models of MICR devices do not require any check handling processing from the application. Such devices may always be capable of receiving a check and require no commands to actually read and eject the check. For these types of MICR devices, the **BeginInsertion**, **EndInsertion**, **BeginRemoval** and **EndRemoval** methods simply return an OPOS_SUCCESS status, and the Control will enqueue the data until the **DataEventEnabled** property is set to TRUE. However, applications should still use these methods to ensure application portability across different MICR devices.

Device Sharing

The MICR is an exclusive-use device, as follows:

- The application must claim the device before enabling it.
- The application must claim and enable the device before the device begins reading input, or before calling methods that manipulate the device.
- See the "Summary" table for precise usage prerequisites.

MICR Character Substitution

The E13B MICR format used by the ANSI MICR standard contains 15 possible characters. Ten of these are the numbers 0 through 9. A space character may also be returned. The other four characters are special to MICR data and are known as the *Transit*, *Amount*, *On-Us*, and *Dash* characters. These characters are used to mark the boundaries of certain special fields in MICR data. Since these four characters are not in the ASCII character set, the following lower-case characters will be used to represent them in properties and parameters to methods:

MICR Character	Name	Substitute Character
	Transit	t
	Amount	a
	On-Us	o
	Dash	-

Properties

AccountNumber Property

Syntax	BSTR AccountNumber;
Remarks	<p>A string containing the account number parsed from the most recently read MICR data.</p> <p>This account number will not include a check serial number if a check serial number is able to be separately parsed, even if the check serial number is embedded in the account number portion of the 'On Us' field.</p> <p>If the account number cannot be identified successfully, the string will be empty ("").</p> <p>Its value is set prior to a DataEvent being sent to the application.</p>
See Also	RawData Property; DataEvent

Amount Property

Syntax	BSTR Amount;
Remarks	<p>A string containing the amount field parsed from the most recently read MICR data.</p> <p>The amount field on a check consists of ten digits bordered by Amount symbols. All non space digits will be represented in the test string including leading 0's.</p> <p>If the amount is not present, the string will be empty ("").</p> <p>Its value is set prior to a DataEvent being sent to the application.</p>
See Also	RawData Property; DataEvent

BankNumber Property

Syntax	BSTR BankNumber;
Remarks	<p>A string containing the bank number portion of the transit field parsed from the most recently read MICR data.</p> <p>The bank number is contained in digits 4 through 8 of the transit field.</p> <p>If the bank number or transit field is not present or successfully identified, the string will be empty ("").</p> <p>Its value is set prior to a DataEvent being sent to the application.</p>
See Also	RawData Property; TransitNumber Property; DataEvent

CapValidationDevice Property

Syntax	BOOL CapValidationDevice;
Remarks	<p>Indicates if this device also performs validation printing via the POS Printer Control's slip station.</p> <p>If its value is TRUE, a check does not have to be removed from the MICR device prior to performing validation printing. For devices that are both a MICR device as well as a POS Printer, the device will automatically position the check for validation printing after successfully performing a MICR read. Either the MICR Control's or the POS Printer Control's BeginRemoval and EndRemoval methods may be called to remove the check once processing is complete.</p> <p>This property is initialized by the Open method.</p>

CheckType Property

Syntax **LONG CheckType;**

Remarks A number that represents the type of check parsed from the most recently read MICR data.

Values are:

Value	Meaning
--------------	----------------

MICR_CT_PERSONAL	The check is a personal check.
------------------	--------------------------------

MICR_CT_BUSINESS	The check is a business or commercial check.
------------------	--

MICR_CT_UNKNOWN	Unknown type of check.
-----------------	------------------------

Its value is set prior to a **DataEvent** being sent to the application.

See Also **RawData** Property; **DataEvent**

CountryCode Property

Syntax **LONG CountryCode;**

Remarks A number that represents the country of origin of the check parsed from the most recently read MICR data.

Values are:

Value	Meaning
--------------	----------------

MICR_CC_USA	The check is from America.
-------------	----------------------------

MICR_CC_CANADA	The check is from Canada.
----------------	---------------------------

MICR_CC_MEXICO	The check is from Mexico.
----------------	---------------------------

MICR_CC_UNKNOWN	Check origination is unknown.
-----------------	-------------------------------

Its value is set prior to a **DataEvent** being sent to the application.

See Also **RawData** Property; **DataEvent**

EPC Property

Syntax	BSTR EPC;
Remarks	<p>A string containing the Extended Processing Code (“EPC”) field parsed from the most recently read MICR data. The string will contain a single character 0 through 9 if the field is present. If not, the string will be empty (“”).</p> <p>Its value is set prior to a DataEvent being sent to the application.</p>
See Also	RawData Property; DataEvent

RawData Property

Syntax	BSTR RawData;
Remarks	<p>A string containing the MICR data from the most recent MICR read.</p> <p>The string contains any of the 15 MICR characters with appropriate substitution to represent non-ASCII characters (see “MICR Character Substitution”, page 457). No parsing or special processing is done to the data returned in this string. A sample value may look like the following:</p> <pre>“2t123456789t123 4 567890o 123 a0000001957a”</pre> <p>Note that the property value will include spaces to represent spaces in the MICR data.</p> <p>Its value is set prior to a DataEvent being sent to the application.</p>
See Also	AccountNumber Property; Amount Property; BankNumber Property; CheckType Property; CountryCode Property; EPC Property; SerialNumber Property; TransitNumber Property; DataEvent

SerialNumber Property

Syntax	BSTR SerialNumber;
Remarks	<p>A string containing the serial number of the check parsed from the most recently read MICR data.</p> <p>If the serial number cannot be successfully parsed, the value of this property will be empty ("").</p> <p>Its value is set prior to a DataEvent being sent to the application.</p>
See Also	RawData Property; DataEvent

TransitNumber Property

Syntax	BSTR TransitNumber;
Remarks	<p>A string containing the transit field of the check parsed from the most recently read MICR data.</p> <p>The transmit number consists of all the characters read between the 'Transit' symbols on the check. It is a nine character string.</p> <p>Its value is set prior to a DataEvent being sent to the application.</p>
See Also	RawData Property; DataEvent

Methods

BeginInsertion Method

Syntax **LONG BeginInsertion (LONG Timeout);**

The *Timeout* parameter gives the number of milliseconds before failing the method. If zero, the method tries to begin insertion mode, then returns the appropriate status immediately.

If OPOS_FOREVER (-1), the method tries to begin insertion mode, then waits as long as needed until either the check is inserted or an error occurs.

Remarks Called to initiate check insertion processing.

When called, the MICR is made ready to receive a check by opening the MICR's check handling "jaws" or activating a MICR's check insertion mode. This method is paired with the **EndInsertion** method for controlling check insertion. For MICR devices that do not require this sort of processing, these methods will always return OPOS_SUCCESS. However, the application should still use these methods to ensure application portability across different MICR devices.

If the MICR device cannot be placed into insertion mode, an error is returned to the application. Otherwise, the Control continues to monitor check insertion until either:

- The check is successfully inserted. In this case, the Control returns an OPOS_SUCCESS status.
- The check is not inserted before *Timeout* milliseconds have elapsed, or an error is reported by the MICR device. In this case, the Control either returns OPOS_E_TIMEOUT or another error. The MICR device remains in check insertion mode. This allows an application to perform some user interaction and reissue the **BeginInsertion** method without altering the MICR check handling mechanism.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was initiated successfully.
OPOS_E_BUSY	If the MICR is a combination device, the peer device may be busy.
OPOS_E_ILLEGAL	An invalid <i>Timeout</i> parameter was specified.
OPOS_E_TIMEOUT	The specified time has elapsed without the check being properly inserted.
<i>Other Values</i>	See ResultCode .

See Also **EndInsertion** Method; **BeginRemoval** Method; **EndRemoval** Method

BeginRemoval Method

Syntax **LONG BeginRemoval (LONG *Timeout*);**

The *Timeout* property gives the number of milliseconds before failing the method. If zero, the method tries to begin removal mode, then returns the appropriate status immediately.

If OPOS_FOREVER (-1), the method tries to begin removal mode, then waits as long as needed until either the check is removed or an error occurs.

Remarks Called to initiate check removal processing.

When called, the MICR is made ready to remove a check, by opening the MICR's check handling "jaws" or activating a MICR's check ejection mode. This method is paired with the **EndRemoval** method for controlling check removal. For MICR devices that do not require this sort of processing, these methods will always return OPOS_SUCCESS. However, the application should still use these methods to ensure application portability across different MICR devices.

If the MICR device cannot be placed into removal or ejection mode, an error is returned to the application. Otherwise, the Control continues to monitor check removal until either:

- The check is successfully removed. In this case, the Control returns an OPOS_SUCCESS status.
- The check is not removed before *Timeout* milliseconds have elapsed, or an error is reported by the MICR device. In this case, the Control either returns OPOS_E_TIMEOUT or another error. The MICR device remains in check removal mode. This allows an application to perform some user interaction and reissue the **BeginRemoval** method without altering the MICR check handling mechanism.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was initiated successfully.
OPOS_E_BUSY	If the MICR is a combination device, the peer device may be busy.
OPOS_E_ILLEGAL	An invalid <i>Timeout</i> parameter was specified.
OPOS_E_TIMEOUT	The specified time has elapsed without the check being properly removed.
<i>Other Values</i>	See ResultCode .

See Also **BeginInsertion** Method; **EndInsertion** Method; **EndRemoval** Method

EndInsertion Method

Syntax **LONG EndInsertion ();**

Remarks Called to end check insertion processing.

When called, the MICR is taken out of check insertion mode. If a check is detected in the device, a successful status of OPOS_SUCCESS is returned to the application. If no check is present, an extended error status OPOS_EMICR_NOCHECK is returned. Upon completion of this method, the check will be read by the MICR device, and data will be available as soon as the **DataEventEnabled** property is set to TRUE. This allows an application to prompt the user prior to calling this method to ensure that the form is correctly positioned.

This method is paired with the **BeginInsertion** method for controlling check insertion. For MICR devices that do not require this sort of processing, these methods will always return OPOS_SUCCESS. However, the application should still use these methods to ensure application portability across different MICR devices.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was initiated successfully.
OPOS_E_ILLEGAL	The printer is not in check insertion mode.
OPOS_E_EXTENDED	ResultCodeExtended = OPOS_EMICR_NOCHECK: The device was taken out of insertion mode without a check being inserted.
<i>Other Values</i>	See ResultCode .

See Also **BeginInsertion** Method; **BeginRemoval** Method; **EndRemoval** Method

EndRemoval Method

Syntax **LONG EndRemoval ();**

Remarks Called to end check removal processing.

When called, the MICR is taken out of check removal or ejection mode. If no check is detected in the device, a successful status of OPOS_SUCCESS is returned to the application. If a check is present, an extended error status OPOS_EMICR_CHECK is returned.

This method is paired with the **BeginRemoval** method for controlling check removal. For MICR devices that do not require this sort of processing, these methods will always return OPOS_SUCCESS. However, the application should still use these methods to ensure application portability across different MICR devices.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was initiated successfully.
OPOS_E_ILLEGAL	The printer is not in check removal mode.
OPOS_E_EXTENDED	ResultCodeExtended = OPOS_EMICR_CHECK: The device was taken out of removal mode while a check is still present.
<i>Other Values</i>	See ResultCode .

See Also **BeginInsertion** Method; **EndInsertion** Method; **BeginRemoval** Method

Events

DataEvent Event

- Syntax** **void DataEvent (LONG Status);**
 The *Status* parameter contains zero.
- Remarks** Fired when MICR data is read from a check.
 Before delivering this event, the MICR Control updates the **RawData** property and attempts to parse this data into the MICR data fields.
- See Also** **RawData** Property; **AccountNumber** Property; **Amount** Property; **BankNumber** Property; **CheckType** Property; **CountryCode** Property; **EPC** Property; **SerialNumber** Property; **TransitNumber** Property

ErrorEvent Event

- Syntax** **void ErrorEvent (LONG ResultCode, LONG ResultCodeExtended, LONG ErrorLocus, LONG* pErrorResponse);**

Parameter	Description
<i>ResultCode</i>	Result code causing the error event. See ResultCode for values.
<i>ResultCodeExtended</i>	Extended result code causing the error event. See ResultCodeExtended for values.
<i>ErrorLocus</i>	Location of the error. See values below.
<i>pErrorResponse</i>	Pointer to the error event response. See values below.

The *ErrorLocus* parameter may be one of the following:

Value	Meaning
OPOS_EL_INPUT	Error occurred while gathering or processing event-driven input. No input data is available.
OPOS_EL_INPUT_DATA	Error occurred while gathering or processing event-driven input, and some previously buffered data is available.

The contents at the location pointed to by the *pErrorResponse* parameter is preset to a default value, based on the *ErrorLocus*. The application may change it to one of the following:

Value	Meaning
OPOS_ER_CLEAR	Clear the buffered input data. The error state is exited. Default when locus is OPOS_EL_INPUT.
OPOS_ER_CONTINUEINPUT	Use only when locus is OPOS_EL_INPUT_DATA. Acknowledges the error and directs the Control to continue processing. The Control remains in the error state and will deliver additional DataEvents as directed by the DataEventEnabled property. When all input has been delivered and the DataEventEnabled property is again set to TRUE, then another ErrorEvent is delivered with locus OPOS_EL_INPUT. Default when locus is OPOS_EL_INPUT_DATA.

Remarks Fired when an error is detected while trying to read MICR data.

Input error events are not delivered until the **DataEventEnabled** property is TRUE, so that proper application sequencing occurs.

General Information

The MSR Control's OLE programmatic ID is "OPOS.MSR".

Capabilities

The MSR Control has the following minimal set of capabilities:

- Reads encoded data from a magnetic stripe. Data is obtainable from any combination of tracks 1, 2, 3 and JIS-II.
- The alphanumeric data bytes may be decoded into their corresponding alphanumeric codes. Furthermore, this decoded alphanumeric data may be divided into specific fields accessed as device properties.

The MSR may have the following additional capability:

- Support for specific card types: ISO, JIS Type I, and/or JIS Type II. Note: for the purpose of this standard, the following convention are assumed:
 - ◆ Track 1 is ISO or JIS-I Track 1
 - ◆ Track 2 is ISO or JIS-I Track 2
 - ◆ Track 3 is ISO or JIS-I Track 3
 - ◆ Track 4 is JIS-II data
 - ◆ Determination of the type of card is based on the type of the content the card tracks are expected to hold.
- Support for optionally returning the track sentinels with track data.

Clarifications for JIS-II Data Handling

Prior to Version 1.5 of this specification, it was not clearly stated how the Control should treat JIS-II data and into which of the **Track*n*Data** properties the data should be stored. This version of the specification defines **Track4Data**, which the Control should use to store JIS-II data. However, the Control may also store the JIS-II data into the previously used **Track*n*Data** property. In such cases, the **DataEvent Status** and the **ResultCodeExtended** property should be set to reflect both **Track4Data** and **Track*n*Data**. Note that applications that use this particular method of accessing JIS-II data may not be portable across Controls.

Model

Four writable properties control MSR data handling:

- The **TracksToRead** property controls which combination of the four tracks should be read. It is not an error to swipe a card containing less than this set of tracks. Rather, this property should be set to the set of tracks that the Application may need to process.
- The **DecodeData** property controls decoding of track data from raw format into displayable data.
- The **ParseDecodeData** property controls parsing of decoded data into fields, based on common MSR standards.
- The **ErrorReportingType** property controls the type of handling that occurs when a track containing invalid data is read.

The MSR Control follows the general input model for event-driven input:

- When input is received by the Control, it enqueues a **DataEvent**.
- If the **AutoDisable** property is TRUE, then the control automatically disables itself when a **DataEvent** is enqueued.
- An enqueued **DataEvent** can be delivered to the application when the **DataEventEnabled** property is TRUE. Just before delivering this event, the Control copies the data into properties, and disables further data events by setting the **DataEventEnabled** property to FALSE. This causes subsequent input data to be enqueued by the Control while the application processes the current input and associated properties. When the application has finished the current input and is ready for more data, it reenables events by setting **DataEventEnabled** to TRUE.
- An **ErrorEvent** (or events) are enqueued if the Control encounters an error while gathering or processing input, and is delivered to the application when the **DataEventEnabled** property is TRUE.
- The **DataCount** property may be read to obtain the number of **DataEvents** enqueued by the Control.
- All input enqueued by the Control may be deleted by calling the **ClearInput** method.

Device Sharing

The MSR is an exclusive-use device, as follows:

- The application must claim the device before enabling it.
- The application must claim and enable the device before the device begins reading input, or before calling methods that manipulate the device.
- See the “Summary” table for precise usage prerequisites.

Properties

AccountNumber Property

Syntax	BSTR AccountNumber;
Remarks	<p>The account number obtained from the most recently swiped card.</p> <p>Set to the empty string if:</p> <ul style="list-style-type: none">• The field was not included in the track data obtained, or,• The track data format was not one of those listed in the ParseDecodeData property section of this document, or,• ParseDecodeData is FALSE.

CapISO Property

Syntax	BOOL CapISO;
Remarks	<p>If TRUE, the MSR device supports ISO cards; otherwise it is FALSE.</p> <p>This property is initialized by the Open method.</p>

CapJISOne Property

Syntax	BOOL CapJISOne;
Remarks	<p>If TRUE, the MSR device supports JIS Type-I cards; otherwise it is FALSE.</p> <p>JIS-I cards are a superset of ISO cards. Therefore, if CapJISOne is TRUE, then it is implied that CapISO is also TRUE.</p> <p>This property is initialized by the Open method.</p>

CapJISTwo Property

Syntax	BOOL CapJISTwo;
Remarks	If TRUE, the MSR device supports JIS Type-II cards; otherwise it is FALSE. This property is initialized by the Open method.

CapTransmitSentinels Property *Added in Release 1.5*

Syntax	BOOL CapTransmitSentinels;
Remarks	If TRUE, the device is able to transmit the start and end sentinels. If FALSE, these characters cannot be returned to the application. This property is initialized by the Open method.
See Also	TransmitSentinels Property.

DecodeData Property R/W

Syntax **BOOL DecodeData;**

Remarks If FALSE, the **Track1Data**, **Track2Data**, **Track3Data** and **Track4Data** properties contain the original encoded bit sequence, known as “raw format”.

If TRUE, each byte of track data contained within the **Track1Data**, **Track2Data**, **Track3Data** and **Track4Data** properties is mapped from its raw format to its corresponding decoded ASCII bit sequence. This conversion is mainly of relevance for data that is NOT of the 7-bit format, since 7-bit data needs no decoding to decipher its corresponding alphanumeric and/or Katakana characters.

The decoding that takes place is as follows for each card type, track, and track data format:

<i>Card Type</i>	Track Data Property	Data Format	Raw Bytes	Decoded Bytes
ISO	Track1Data	6-Bit	0x00 - 0x3F	0x20 - 0x5F
	Track2Data	4-Bit	0x00 - 0x0F	0x30 - 0x3F
	Track3Data	4-Bit	0x00 - 0x0F	0x30 - 0x3F
JIS-I	Track1Data	6-Bit	0x00 - 0x3F	0x20 - 0x5F
	Track1Data	7-Bit	0x00 - 0x7F	Unchanged
	Track2Data	4-Bit	0x00 - 0x0F	0x30 - 0x3F
	Track3Data	4-Bit	0x00 - 0x0F	0x30 - 0x3F
	Track3Data	7-Bit	0x00 - 0x7F	Unchanged
JIS-II	Track4Data	7-Bit	0x00 - 0x7F	Unchanged

This property is initialized to TRUE by the **Open** method.

Setting this property to FALSE automatically sets the **ParseDecodeData** property to FALSE.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.

See Also **ParseDecodeData** Property

ErrorReportingType Property R/W *Added in Release 1.2***Syntax** **LONG ErrorReportingType;****Remarks** An error is reported by an **ErrorEvent** when a card is swiped, and one or more of the tracks specified by the **TracksToRead** property contains data with errors.

When the **ErrorEvent** is fired to the application, two types of error reporting are supported:

- Card level: A general error status is given, with no data returned. This level should be used when a simple pass/fail of the card data is sufficient.
- Track level: The Control can return an extended status with a separate status for each of the tracks. Also, for those tracks that contain valid data or no data, the track's properties are updated as with a **DataEvent**. For those tracks that contain invalid data, the track's properties are set to empty. This level should be used when the application may be able to utilize a successfully read track or tracks when another of the tracks contains errors. For example, suppose **TracksToRead** is MSR_TR_1_2_3, and a swiped card contains good track 1 and 2 data, but track 3 contains "random noise" that is flagged as an error by the MSR. With track level error reporting, the **ErrorEvent** sets the track 1 and 2 properties with the valid data, sets the track 3 properties to empty, and returns an error code indicating the status of each track.

Value	Meaning
MSR_ERT_CARD	Report errors at a card level.
MSR_ERT_TRACK	Report errors at a track level.

This property is initialized to MSR_ERT_CARD by the **Open** method, which is the functionality supported prior to Release 1.2.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An invalid value was specified.

See Also **ErrorEvent**

ExpirationDate Property

Syntax **BSTR ExpirationDate;**

Remarks The expiration date obtained from the most recently swiped card, as four ASCII decimal characters in the form YYMM. For example, February 1998 is “9802” and August 2018 is “1808”.

Set to the empty string if:

- The field was not included in the track data obtained, or,
- The track data format was not one of those listed in the **ParseDecodeData** property section of this document, or,
- **ParseDecodeData** is FALSE.

FirstName Property

Syntax **BSTR FirstName;**

Remarks The first name obtained from the most recently swiped card.

Set to the empty string if:

- The field was not included in the track data obtained, or,
- The track data format was not one of those listed in the **ParseDecodeData** property section of this document, or,
- **ParseDecodeData** is FALSE.

MiddleInitial Property

Syntax **BSTR MiddleInitial;**

Remarks The middle initial obtained from the most recently swiped card.

Set to the empty string if:

- The field was not included in the track data obtained, or,
- The track data format was not one of those listed in the **ParseDecodeData** property section of this document, or,
- **ParseDecodeData** is FALSE.

ParseDecodeData Property R/W

Syntax	BOOL ParseDecodeData; BOOL ParseDecodedData; (Synonym for ParseDecodeData . ⁷)				
Remarks	<p>If TRUE, the decoded data contained within the Track1Data and Track2Data properties is further separated into fields for access via various other properties. Track3Data is not parsed because its data content is of an open format defined by the card issuer. JIS-I Track 1 Format C and ISO Track 1 Format C data are not parsed for similar reasons. Track4Data is also not parsed.</p> <p>The parsed data properties are the defined possible fields for cards with data consisting of the following formats:</p> <ul style="list-style-type: none">• JIS-I / ISO Track 1 Format A• JIS-I / ISO Track 1 Format B• JIS-I / ISO Track 1 VISA Format (a de-facto standard)• JIS-I / ISO Track 2 Format <p>This property is initialized to TRUE by the Open method.</p> <p>Setting this property to TRUE automatically sets the DecodeData property to TRUE.</p>				
Return	<p>When this property is set, the following value is placed in the ResultCode property:</p> <table><tr><th>Value</th><th>Meaning</th></tr><tr><td>OPOS_SUCCESS</td><td>The property was set successfully.</td></tr></table>	Value	Meaning	OPOS_SUCCESS	The property was set successfully.
Value	Meaning				
OPOS_SUCCESS	The property was set successfully.				
See Also	DecodeData Property; Surname Property; Suffix Property; AccountNumber Property; FirstName Property; MiddleInitial Property; Title Property; ExpirationDate Property; ServiceCode Property; Track1DiscretionaryData Property; Track2DiscretionaryData Property				

⁷ An MSR Control Object must support the property **ParseDecodeData**. In addition, due to a documentation error in OPOS APG Releases 1.1 and earlier, it is recommended that the property **ParseDecodedData** also be supported, and that it refer to the same property.

ServiceCode Property

Syntax	BSTR ServiceCode;
Remarks	<p>The service code obtained from the most recently swiped card.</p> <p>Set to the empty string if:</p> <ul style="list-style-type: none">• The field was not included in the track data obtained, or,• The track data format was not one of those listed in the ParseDecodeData property section of this document, or,• ParseDecodeData is FALSE.

Suffix Property

Syntax	BSTR Suffix;
Remarks	<p>The suffix obtained from the most recently swiped card.</p> <p>Set to the empty string if:</p> <ul style="list-style-type: none">• The field was not included in the track data obtained, or,• The track data format was not one of those listed in the ParseDecodeData property section of this document, or,• ParseDecodeData is FALSE.

Surname Property

Syntax	BSTR Surname;
Remarks	<p>The surname obtained from the most recently swiped card.</p> <p>Set to the empty string if:</p> <ul style="list-style-type: none">• The field was not included in the track data obtained, or,• The track data format was not one of those listed in the ParseDecodeData property section of this document, or,• ParseDecodeData is FALSE.

Title Property

Syntax	BSTR Title;
Remarks	<p>The title obtained from the most recently swiped card.</p> <p>Set to the empty string if:</p> <ul style="list-style-type: none">• The field was not included in the track data obtained, or,• The track data format was not one of those listed in the ParseDecodeData property section of this document, or,• ParseDecodeData is FALSE.

Track1Data Property

Syntax	BSTR Track1Data;
Remarks	<p>Contains either the track 1 data from the previous card swipe or an empty string.</p> <p>If TransmitSentinels is FALSE, this property contains track data between, but not including, the start and end sentinels. If TransmitSentinels is TRUE then the start and end sentinels are included.</p> <p>If DecodeData is TRUE, then the data returned by this property has been decoded from “raw” format. The data may also be parsed into other properties when the ParseDecodeData property is set.</p> <p>An empty string indicates that the track was not accessible.</p>
See Also	TracksToRead Property

Track1DiscretionaryData Property

Syntax	BSTR Track1DiscretionaryData;
Remarks	<p>The track 1 discretionary data obtained from the most recently swiped card.</p> <p>Set to the empty string if:</p> <ul style="list-style-type: none">• The field was not included in the track data obtained, or,• The track data format was not one of those listed in the ParseDecodeData property section of this document, or,• ParseDecodeData is FALSE. <p>The amount of data contained in this property varies widely depending upon the format of the track 1 data.</p>

Track2Data Property

Syntax **BSTR Track2Data;**

Remarks Contains either the track 2 data from the previous card swipe or an empty string.

If **TransmitSentinels** is FALSE, this property contains track data between, but not including, the start and end sentinels. If **TransmitSentinels** is TRUE then the start and end sentinels are included.

If **DecodeData** is TRUE, then the data returned by this property has been decoded from “raw” format. It may also be parsed into other properties when the **ParseDecodeData** property is set.

An empty string indicates that the track was not accessible.

See Also **TracksToRead** Property

Track2DiscretionaryData Property

Syntax **BSTR Track2DiscretionaryData;**

Remarks The track 2 discretionary data obtained from the most recently swiped card.

Set to the empty string if:

- The field was not included in the track data obtained, or,
- The track data format was not one of those listed in the **ParseDecodeData** property section of this document, or,
- **ParseDecodeData** is FALSE.

Track3Data Property

Syntax **BSTR Track3Data;**

Remarks Contains either the track 3 data from the previous card swipe or an empty string.

If **TransmitSentinels** is FALSE, this property contains track data between, but not including, the start and end sentinels. If **TransmitSentinels** is TRUE then the start and end sentinels are included.

If **DecodeData** is TRUE, then the data returned by this property has been decoded from “raw” format.

An empty string indicates that the track was not accessible.

See Also **TracksToRead** Property

Track4Data Property

Added in Release 1.5

Syntax **BSTR Track4Data;**

Remarks Holds the track 4 data (JIS-II) from the most recently swiped card.

If **TransmitSentinels** is FALSE, this property contains track data between, but not including, the start and end sentinels. If **TransmitSentinels** is TRUE then the start and end sentinels are included.

If **DecodeData** is TRUE, then the data returned by this property has been decoded from “raw” format.

An empty string indicates that the track was not accessible.

To maintain compatibility with previous versions, the Control may also continue to store the JIS-II data in another **Track*n*Data** property. However, it should be noted that to ensure application portability, **Track4Data** should be used to access JIS-II data.

See Also **TracksToRead** Property

TracksToRead Property R/W

Syntax **LONG TracksToRead;**

Remarks Indicates the track data that the application wishes to have placed into the **Track1Data**, **Track2Data**, **Track3Data** and **Track4Data** properties following a card swipe.

Value	Meaning
MSR_TR_1	Obtain Track 1.
MSR_TR_2	Obtain Track 2.
MSR_TR_3	Obtain Track 3.
MSR_TR_1_2	Obtain Tracks 1 and 2.
MSR_TR_1_3	Obtain Tracks 1 and 3.
MSR_TR_2_3	Obtain Tracks 2 and 3.
MSR_TR_1_2_3	Obtain Tracks 1, 2, and 3.
MSR_TR_4	Obtain Track 4.
MSR_TR_1_4	Obtain Tracks 1 and 4.
MSR_TR_2_4	Obtain Tracks 2 and 4.
MSR_TR_3_4	Obtain Tracks 3 and 4.
MSR_TR_1_2_4	Obtain Tracks 1, 2 and 4.
MSR_TR_1_3_4	Obtain Tracks 1, 3 and 4.
MSR_TR_2_3_4	Obtain Tracks 2, 3 and 4.
MSR_TR_1_2_3_4	Obtain Tracks 1, 2, 3 and 4.

Decreasing the required number of tracks may provide a greater swipe success rate and somewhat greater responsiveness by removing the processing for unaccessed data.

TracksToRead does not indicate a capability of the MSR hardware unit, but instead is an application configurable property representing which track(s) will have their data obtained, potentially decoded, and returned *if possible*. Cases such as an ISO type card being swiped through a JIS-II read head, cards simply not having data for particular tracks, and other factors may preclude desired data from being obtained.

This property is initialized by the **Open** method to MSR_TR_1_2_3.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An invalid track value was specified.

TransmitSentinels Property R/W Added in Release 1.5

Syntax **BOOL TransmitSentinels;**

Remarks If TRUE, the **Track1Data**, **Track2Data**, **Track3Data** and **Track4Data** properties contain start sentinel and end sentinel values.

If FALSE, then these properties only contain the track data between these sentinels.

This property is initialized to FALSE by the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	The CapTransmitSentinels property is FALSE.

See Also **CapTransmitSentinels** Property; **Track1Data** Property; **Track2Data** Property; **Track3Data** Property; **Track4Data** Property.

Events

DataEvent Event

Updated in Release 1.5

Syntax **void DataEvent (LONG Status);**

The *Status* parameter is divided into four bytes with the bytes representing information about the four tracks. The diagram below indicates how the parameter *Status* is divided:

High Word		Low Word	
High Byte	Low Byte	High Byte	Low Byte
Track 4	Track 3	Track 2	Track 1

A value of zero for a track byte means that no data was obtained from the swipe for that particular track. This might be due to the hardware device simply not having a read head for the track, or perhaps the application intentionally precluded incoming data from the track via the **TracksToRead** property.

A value greater than zero (> 0) indicates the length in bytes of the corresponding **TrackData** property.

Remarks Fired to indicate input data from the device to the application.

Before delivering the event, the swiped data is placed into **Track1Data**, **Track2Data**, **Track3Data** and **Track4Data**. If **DecodeData** is TRUE, then this track data is decoded. If **ParseDecodeData** is TRUE, then the data is parsed into several additional properties.

ErrorEvent Event

Updated in Release 1.5

Syntax **void ErrorEvent (LONG ResultCode, LONG ResultCodeExtended, LONG ErrorLocus, LONG* pErrorResponse);**

Parameter	Description
<i>ResultCode</i>	Result code causing the error event. See values below.
<i>ResultCodeExtended</i>	Extended result code causing the error event. See values below.
<i>ErrorLocus</i>	Location of the error. See values below.
<i>pErrorResponse</i>	Pointer to the error event response. See values below.

If the **ErrorReportingType** property is MSR_ERT_CARD, then the *ResultCode* parameter may be one of the following:

Value	Meaning
OPOS_E_EXTENDED	ResultCodeExtended = OPOS_EMSR_START: Start sentinel error.
	ResultCodeExtended = OPOS_EMSR_END: End sentinel error.
	ResultCodeExtended = OPOS_EMSR_PARITY: Parity error.
	ResultCodeExtended = OPOS_EMSR_LRC: LRC error.
<i>Other Values</i>	See ResultCode .

If the **ErrorReportingType** property is MSR_ERT_TRACK, then the *ResultCode* parameter may be one of the following:

Value	Meaning												
OPOS_E_EXTENDED	ResultCodeExtended = Track-level status, broken down as follows:												
<table><tr><th colspan="2">High Word</th><th colspan="2">Low Word</th></tr><tr><th>High Byte</th><th>Low Byte</th><th>High Byte</th><th>Low Byte</th></tr><tr><td>Track 4</td><td>Track 3</td><td>Track 2</td><td>Track 1</td></tr></table>		High Word		Low Word		High Byte	Low Byte	High Byte	Low Byte	Track 4	Track 3	Track 2	Track 1
High Word		Low Word											
High Byte	Low Byte	High Byte	Low Byte										
Track 4	Track 3	Track 2	Track 1										

Each of the track status bytes may be one of the following:

OPOS_SUCCESS	No error.
OPOS_EMSR_START	Start sentinel error.
OPOS_EMSR_END	End sentinel error.
OPOS_EMSR_PARITY	Parity error.
OPOS_EMSR_LRC	LRC error.
OPOS_E_FAILURE	Other or general error.

Other Values See **ResultCode**.

The *ErrorLocus* parameter may be one of the following:

Value	Meaning
OPOS_EL_INPUT	Error occurred while gathering or processing event-driven input. No input data is available.
OPOS_EL_INPUT_DATA	Error occurred while gathering or processing event-driven input, and some previously buffered data is available.

The contents at the location pointed to by the *pErrorResponse* parameter are preset to a default value, based on the *ErrorLocus*. The application may change it to one of the following:

Value	Meaning
OPOS_ER_CLEAR	Clear the buffered input data. The error state is exited. Default when locus is OPOS_EL_INPUT.
OPOS_ER_CONTINUEINPUT	Use only when locus is OPOS_EL_INPUT_DATA. Acknowledges the error and directs the Control to continue processing. The Control remains in the error state and will deliver additional DataEvents as directed by the DataEventEnabled property. When all input has been delivered and the DataEventEnabled property is again set to TRUE, then another ErrorEvent is delivered with locus OPOS_EL_INPUT. Default when locus is OPOS_EL_INPUT_DATA.

Remarks Fired when an error is detected while trying to read MSR data.

Input error events are not delivered until the **DataEventEnabled** property is TRUE, so that proper application sequencing occurs.

If the **ErrorReportingType** property is MSR_ERT_CARD, then the track that caused the fault cannot be determined, and the track data properties are not changed.

If the **ErrorReportingType** property is MSR_ERT_TRACK, then the *ResultCode* and *ResultCodeExtended* parameters may indicate the track-level status. Also, the track data properties are updated as with **DataEvent**, with the properties for the track or tracks in error set to empty strings. Unlike **DataEvent**, individual track lengths are not reported. However, the application can determine their lengths by getting the length of each of the **TrackData** properties. Also, since this is an **ErrorEvent**

(even though it is reporting partial data), the **DataCount** property is not incremented and the Control remains enabled, regardless of the **AutoDisable** property value.

See Also “Status, Result Code, and State Model”; **ErrorReportingType** Property

CHAPTER 13

PIN Pad

Summary

Properties

<i>Common</i>	<i>Ver</i>	<i>Type</i>	<i>Access</i>	<i>May Use After</i>

General Information

The Pinpad Control's OLE programmatic ID is "OPOS.PINPad".

This device was added in OPOS Release 1.3.

A Pinpad

- Provides a mechanism for customers to perform PIN Entry
- Acts as a cryptographic engine for communicating with an EFT Transaction Host.

A Pinpad will perform these functions by implementing one or more Pinpad Management Systems. A Pinpad Management System defines the manner in which the Pinpad will perform functions such as PIN Encryption, Message Authentication Code calculation, and Key Updating. Examples of Pinpad Management Systems include: Master-Session, DUKPT, APACS40, HGEPOS, AS2805, and JDEBIT2 along with many others.

Capabilities

The Pinpad Control has the following minimal capability:

- Accept a PIN Entry at its keyboard and provide an Encrypted PIN to the application.

The Pinpad Control may have the following additional capabilities:

- Compute Message Authentication Codes.
- Perform Key Updating in accordance with the selected Pinpad Management System.
- Support multiple Pinpad Management Systems.
- Allow use of the Pinpad Keyboard, Display, & Tone Generator for application usage. If one or more of these features are available, then the Application opens and uses the associated POS Keyboard, Line Display, or Tone Indicator Control Objects.

Features Not Supported

This specification does not include support for the following:

- Initial Key Loading. This operation usually requires downloading at least one key in the clear and must be done in a secure location (typically either the factory or at a Financial Institution). Thus, support for initial key loading is outside the scope of this specification. However, this specification does include support for updating keys while a Pinpad unit is installed at a retail site.
- Full EFT functionality. This specification addresses the functionality of a Pinpad that is used solely as a peripheral device by an Electronic Funds Transfer application. It specifically does not define the functionality of an Electronic Funds Transfer application that might execute within an intelligent Pinpad. This specification does not include support for applications in which the Pinpad Application determines that a message needs to be transmitted to the EFT Transaction Host. *Consequently, this specification will not apply in Canada, Germany, Netherlands, and possibly other countries. It also does not apply to Pinpads in which the vendor has chosen to provide EFT Functionality in the Pinpad.*
- Smartcard Reader. Some Pinpad devices will include a Smartcard reader. Support for this device may be included in a future revision of this specification.

Model

A Pinpad performs encryption functions under control of a Pinpad Management System. Some Pinpads will support multiple Pinpad Management Systems. Some Pinpad Management Systems support multiple keys (sets) for different EFT Transaction Hosts. Thus, for each EFT transaction, the application will need to select the Pinpad Management System and EFT Transaction Host to be used. Depending on the Pinpad Management System, one or more EFT transaction parameters will need to be provided to the Pinpad for use in the encryption functions. The application should set the value of **ALL** EFT Transaction parameter properties to enable easier migration to EFT Transaction Hosts that require a different Pinpad Management System.

After opening, claiming, and enabling the Pinpad Control, the application should use the following general scenario for each EFT Transaction.

- The application must set the EFT transaction parameters (**AccountNumber**, **Amount**, **MerchantID**, **TerminalID**, **Track1Data**, **Track2Data**, **Track3Data**, **Track4Data** and **TransactionType** properties) and then perform a **BeginEFTTransaction** method. This will initialize the Service Object and Pinpad for performing the encryption functions for the EFT transaction.
- If PIN Entry is required, call the **EnablePINEntry** method. Then set the **DataEventEnabled** property and wait for the **DataEvent** event.
- If Message Authentication Codes are required, use the **ComputeMAC** and **VerifyMAC** methods as needed.
- Perform an **EndEFTTransaction** method to notify the Control that all operations for the EFT transaction have been completed.

This specification supports 2 models of how the display on the Pinpad is used. The **CapDisplay** property indicates which model the Pinpad device supports.

- In one model, the Application has complete control of the text that is to be displayed. For this model, there is an associated OPOS Line Display Control that is used by the Application to interact with the display.
- In the other model, the Application cannot supply the text to be displayed. Instead, it can only select from a list of pre-defined messages to be displayed. For this model, there is a set of Pinpad properties that are used to control the display.

Device Sharing

The Pinpad is an exclusive-use device, as follows:

- The application must claim the device before enabling it.
- The application must claim and enable the device before the device begins reading input, or before calling methods that manipulate the device.
- See the “Summary” table for precise usage prerequisites.

Properties

AccountNumber Property R/W

Syntax **BSTR AccountNumber;**

Remarks The account number to be used for the current EFT transaction. The application must set this property before calling the **BeginEFTTransaction** method. Any attempt to change this property after the **BeginEFTTransaction** method has been called will result in a value of OPOS_E_ILLEGAL being stored into **ResultCode**.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	The BeginEFTTransaction method was called before the attempt to set this property.
<i>Other Values</i>	See ResultCode .

AdditionalSecurityInformation Property

Syntax **BSTR AdditionalSecurityInformation;**

Remarks This property may contain additional security/encryption information after a **DataEvent** event. This property will be formatted as a Hex-ASCII string. The information content and internal format of this string will vary among Pinpad Management Systems. For example, if the Pinpad Management System is DUKPT, then this property will contain the “Pinpad sequence number”. If the PIN Entry was canceled, this property will contain the empty string.

Amount Property R/W

Syntax CURRENCY Amount;

Remarks The amount of the current EFT transaction. The application must set this property before calling the **BeginEFTTransaction** method. Any attempt to change this property after the **BeginEFTTransaction** method has been called will result in a value of OPOS_E_ILLEGAL being stored into **ResultCode**.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	The BeginEFTTransaction method was called before the attempt to set this property.
<i>Other Values</i>	See ResultCode .

AvailableLanguagesList Property

Syntax BSTR AvailableLanguagesList;

Remarks This property is a comma separated string of the languages supported by the pre-defined prompts in the Pinpad. Languages are numeric values and are Microsoft Language Ids. If **CapLanguage** = PPAD_LANG_NONE, then this property will be the empty string.

This property is initialized by the **Open** method.

AvailablePromptsList Property

Syntax **BSTR AvailablePromptsList;**

Remarks This property is a comma-separated string of supported values for the **Prompt** property.

Name (Value)	Meaning
PPAD_MSG_ENTERPIN (1)	The user should enter his pin number on the Pinpad.
PPAD_MSG_PLEASEWAIT (2)	The system is processing. The user should wait.
PPAD_MSG_ENTERVALIDPIN (3)	The pin that was entered is not correct. The user should enter the correct pin number.
PPAD_MSG_RETRIESEXCEEDED (4)	The user has failed to enter the correct pin number and the maximum number of attempts has been exceeded.
PPAD_MSG_APPROVED (5)	The request has been approved.
PPAD_MSG_DECLINED (6)	The EFT Transaction Host has declined to perform the requested function.
PPAD_MSG_CANCELED (7)	The request is canceled.
PPAD_MSG_AMOUNTOK (8)	The customer should enter Yes/No to approve the amount.
PPAD_MSG_NOTREADY (9)	Pinpad is not ready for use by customer.
PPAD_MSG_IDLE (10)	The System is Idle.
PPAD_MSG_SLIDE_CARD (11)	The user should slide their card through the integrated MSR.
PPAD_MSG_INSERTCARD (12)	The customer should insert their (smart)card.

PPAD_MSG_SELECTCARDTYPE (13)

The customer should select the card type (typically credit or debit).

Values 1000 and above are reserved for device specific defined values.

This property is initialized by the **Open** method.

CapDisplay Property

Syntax **LONG CapDisplay;**

Remarks Defines the operations that the Application may perform on the Pinpad display.

Value	Meaning
PPAD_DISP_UNRESTRICTED	The application can use the Pinpad display in an unrestricted manner to display messages. In this case, an associated Line Display Control Object is the interface to the Pinpad display. The Application must call Line Display methods to manipulate the display.
PPAD_DISP_PINRESTRICTED	The Application can use the Pinpad display in an unrestricted manner except during PIN Entry. The Pinpad will display a pre-defined message during PIN Entry. If an attempt is made to use the associated Line Display Control Object while PIN Entry is enabled, the Line Display Control will return a result of OPOS_E_BUSY.
PPAD_DISP_RESTRICTED_LIST	The Application cannot specify the text of messages to display. It can only select from a list of pre-defined messages. There is no associated Line Display Control Object.
PPAD_DISP_RESTRICTED_ORDER	The application cannot specify the text of messages to display. It can only select from a list of pre-defined messages. The selections must occur in a pre-defined acceptable order. There is no associated Line Display Control object.
PPAD_DISP_NONE	The Pinpad device does not have a display.

This property is initialized by the **Open** method.

CapLanguage Property

Syntax **LONG CapLanguage;**

Remarks Defines the capabilities that the application has to select the language of pre-defined messages (e.g. English, French, Arabic).

Value	Meaning
PPAD_LANG_NONE	The Pinpad supports no pre-defined prompt messages. The property will be set to this value if CapDisplay = PPAD_DISP_UNRESTRICTED. Any attempt to set the value of the PromptLanguage property will cause the ResultCode property to have a value of OPOS_E_ILLEGAL.
PPAD_LANG_ONE	The Pinpad supports pre-defined prompt messages in one language. Any attempt to set the value of the PromptLanguage property to other than the default value will cause the ResultCode property to have a value of OPOS_E_ILLEGAL.
PPAD_LANG_PINRESTRICTED	The Pinpad cannot change prompt languages during PIN Entry. The application must set the desired value into the PromptLanguage property before calling EnablePINEntry . Any attempt to set the value of the PromptLanguage while PINEntryEnabled is TRUE will cause the ResultCode property to have a value of OPOS_E_BUSY.
PPAD_LANG_UNRESTRICTED	The application can change the language of pre-defined prompt messages at anytime. The currently displayed message will change immediately.

This property is initialized by the **Open** method.

CapMACCalculation Property

Syntax **BOOL CapMACCalculation;**

Remarks If TRUE, the Pinpad supports MAC calculation.

This property is initialized by the **Open** method.

CapKeyboard Property

Syntax **BOOL CapKeyboard;**

Remarks Defines whether the application can obtain input from the Pinpad keyboard.

If TRUE, the application can use the Pinpad to obtain input. The application will use an associated POS Keyboard Control object as the interface to the Pinpad keyboard. Note that the associated POS Keyboard Control is effectively disabled while **PINEntryEnabled** is TRUE.

If FALSE, the application cannot obtain input directly from the Pinpad keyboard.

This property is initialized by the **Open** method.

CapTone Property

Syntax **BOOL CapTone;**

Remarks If TRUE, the Pinpad has a Tone Indicator. The Tone Indicator may be accessed by use of an associated Tone Indicator Control. If FALSE, there is no Tone Indicator.

This property is initialized by the **Open** method.

EncryptedPIN Property

Syntax **BSTR EncryptedPIN;**

Remarks This property will contain the value of the Encrypted PIN after a **DataEvent** event.

This property will be formatted as a hexadecimal ASCII string. Each character is in the ranges '0' through '9' or 'A' through 'F'. Each pair of characters is the hexadecimal representation for a byte.

Example: If the first four characters are "12FA", then the first two bytes of the PIN are 12 hexadecimal (18) and FA hexadecimal (250).

If the PIN Entry was canceled, this property will contain the empty string.

MaximumPINLength Property R/W

Syntax **LONG MaximumPINLength;**

Remarks The application should set this property to the maximum acceptable number of digits in a PIN. This property must be set by the application before the **EnablePINEntry** method is executed This property will be set to a default value by the **Open** method. Note that in some implementations, this value cannot be changed by the application

MerchantID Property R/W

Syntax	BSTR MerchantID;								
Remarks	The Merchant ID, as it is known to the EFT Transaction Host. The application must set this property before calling the BeginEFTTransaction method. Any attempt to change this property after the BeginEFTTransaction method has been called will result in a value of OPOS_E_ILLEGAL being stored into ResultCode .								
Return	When this property is set, one of the following values is placed in the ResultCode property:								
<table><tr><th>Value</th><th>Meaning</th></tr><tr><td>OPOS_SUCCESS</td><td>The property was set successfully.</td></tr><tr><td>OPOS_E_ILLEGAL</td><td>The BeginEFTTransaction method was called before the attempt to set this property.</td></tr><tr><td><i>Other Values</i></td><td>See ResultCode.</td></tr></table>		Value	Meaning	OPOS_SUCCESS	The property was set successfully.	OPOS_E_ILLEGAL	The BeginEFTTransaction method was called before the attempt to set this property.	<i>Other Values</i>	See ResultCode .
Value	Meaning								
OPOS_SUCCESS	The property was set successfully.								
OPOS_E_ILLEGAL	The BeginEFTTransaction method was called before the attempt to set this property.								
<i>Other Values</i>	See ResultCode .								

MinimumPINLength Property R/W

Syntax	LONG MinimumPINLength;
Remarks	The application should set this property to the minimum acceptable number of digits in a PIN. This property must be set by the application before the EnablePINEntry method is executed. This property will be set to a default value by the Open method. Note that in some implementations, this value cannot be changed by the application.

PINEntryEnabled Property

Syntax	BOOL PINEntryEnabled;
Remarks	The Pinpad Control object sets this property to TRUE when an EnablePINEntry method is executed. It will be set to FALSE when the user has completed the PIN Entry operation or an EndEFTTransaction is executed.

Prompt Property R/W

Syntax **LONG Prompt;**

Remarks This property identifies a pre-defined message to be displayed on the Pinpad. This property is used if **CapDisplay** has a value of PPAD_DISP_RESTRICTED_LIST or PPAD_DISP_RESTRICTED_ORDER. It is also used during PIN Entry if **CapDisplay** has a value of PPAD_DISP_PINRESTRICTED. The **AvailablePromptsList** property lists the values for this property that the Service Object will accept.

This property is initialized by the **Open** method.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	One of the following occurred: <ul style="list-style-type: none">• An attempt was made to set the property to a value that is not supported by the Pinpad Service object• An attempt was made to select prompt messages in an unacceptable order (CapDisplay = PPAD_DISP_RESTRICTED_ORDER)

Other Values See **ResultCode**.

See Also **PromptLanguage**

PromptLanguage Property R/W

Syntax **LONG PromptLanguage;**

Remarks This property specifies the language of the message to be displayed (as specified by the **Prompt** property). This property is used if the **Prompt** property is being used. The exact effect of changing this property depends on the value of the **CapLanguage** property.

The values for this property are MS Windows Language IDs. The property is initialized to a default value by the **Open** method.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An attempt was made to set the property to a value that is not supported by the Pinpad Service object.
<i>Other Values</i>	See ResultCode .

See Also **CapLanguage, AvailableLanguagesList**

TerminalID Property R/W

Syntax **BSTR TerminalID;**

Remarks The terminal ID, as it is known to the EFT Transaction Host. The application must set this property before calling the **BeginEFTTransaction** method. Any attempt to change this property after the **BeginEFTTransaction** method has been called will result in a value of OPOS_E_ILLEGAL being stored into **ResultCode**.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	The BeginEFTTransaction method was called before the attempt to set this property.
<i>Other Values</i>	See ResultCode .

Track1Data Property R/W

Syntax **BSTR Track1Data;**

Remarks Contains either the decoded track 1 data from the previous card swipe or an empty string. An empty string indicates that the track was not physically read. The application must set this property before calling the **BeginEFTTransaction** method. Any attempt to change this property after the **BeginEFTTransaction** method has been called will result in a value of OPOS_E_ILLEGAL being stored into **ResultCode**.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	The BeginEFTTransaction method was called before the attempt to set this property.
<i>Other Values</i>	See ResultCode .

Track2Data Property R/W**Syntax** **BSTR Track2Data;**

Remarks Contains either the decoded track 2 data from the previous card swipe or an empty string. An empty string indicates that the track was not physically read. The application must set this property before calling the **BeginEFTTransaction** method. Any attempt to change this property after the **BeginEFTTransaction** method has been called will result in a value of OPOS_E_ILLEGAL being stored into **ResultCode**.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	The BeginEFTTransaction method was called before the attempt to set this property.
<i>Other Values</i>	See ResultCode .

Track3Data Property R/W

Syntax **BSTR Track3Data;**

Remarks Contains either the decoded track 3 data from the previous card swipe or an empty string. An empty string indicates that the track was not physically read. The application must set this property before calling the **BeginEFTTransaction** method. Any attempt to change this property after the **BeginEFTTransaction** method has been called will result in a value of OPOS_E_ILLEGAL being stored into **ResultCode**.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	The BeginEFTTransaction method was called before the attempt to set this property.
<i>Other Values</i>	See ResultCode .

Track4Data Property R/W**Syntax** **BSTR Track4Data;**

Remarks Contains either the decoded track 4 data from the previous card swipe or an empty string. An empty string indicates that the track was not physically read. The application must set this property before calling the **BeginEFTTransaction** method. Any attempt to change this property after the **BeginEFTTransaction** method has been called will result in a value of OPOS_E_ILLEGAL being stored into **ResultCode**.

To maintain compatibility with previous versions, the control may also continue to store the JIS-II data in another **TracknData** property. However, it should be noted that to ensure application portability, **Track4Data** should be used to access JIS-II data.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	The BeginEFTTransaction method was called before the attempt to set this property.
<i>Other Values</i>	See ResultCode .

TransactionType Property R/W

Syntax **LONG TransactionType;**

Remarks The type of the current EFT transaction. The application must set this property before calling the **BeginEFTTransaction** method. Any attempt to change this property after the **BeginEFTTransaction** method has been called will result in a value of OPOS_E_ILLEGAL being stored into **ResultCode**.

TransactionType can have one of the following values:

Value	Meaning
PPAD_TRANS_DEBIT	Debit (decrease) the specified account
PPAD_TRANS_CREDIT	Credit (increase) the specified account.
PPAD_TRANS_INQ	(Balance) Inquiry
PPAD_TRANS_RECONCILE	Reconciliation/Settlement
PPAD_TRANS_ADMIN	Administrative Transaction

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	The BeginEFTTransaction method was called before the attempt to set this property.
<i>Other Values</i>	See ResultCode .

Methods

BeginEFTTransaction Method

Syntax **LONG BeginEFTTransaction (BSTR *PINPadSystem*,
LONG *TransactionHost*);**

Parameter	Description
<i>PINPadSystem</i>	Name of the desired Pinpad Management System. See below for the Pinpad Management System names defined by this standard. The Service Object implementer may define names for other Pinpad Management systems.
<i>TransactionHost</i>	Identifies the particular EFT Transaction Host to be used for this transaction.

The defined *PINPadSystem* parameter values are:

Value	Meaning
“M/S”	Master/Session. (USA, Latin America)
“DUKPT”	Derived Unique Key Per Transaction (USA, Latin America)
“APACS40”	Standard 40 (UK and other countries)
“AS2805”	Australian Standard 2805
“HGEPOS”	(Italian)
“JDEBIT2”	Japanese Debit 2

Remarks This method must be called by the application to inform the Pinpad Control of the beginning of an EFT Transaction. The Pinpad Control will perform initialization functions (such as computing session keys). No other Pinpad functions can be performed until this method is called.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred:

	<ul style="list-style-type: none"> The requested Pinpad Management System is not supported by the service object. The requested EFT Transaction Host is an illegal value for the selected Pinpad Management System.
OPOS_E_BUSY	The Pinpad is already performing an EFT transaction.
<i>Other Values</i>	See ResultCode .

ComputeMAC Method

Syntax **LONG ComputeMAC (BSTR InMsg, BSTR* pOutMsg);**

Parameter	Description
<i>InMsg</i>	The message that the Application intends to send to an EFT Transaction Host. The format of this data depends upon the value of the BinaryConversion property. See page 39.
<i>pOutMsg</i>	Pointer to the result of applying the MAC calculation to <i>InMsg</i> . This output parameter will contain a reformatted message that may actually be transmitted to an EFT Transaction Host. The format of this data depends upon the value of the BinaryConversion property. See page 39.

Remarks This method is called by the application to have the Pinpad compute a MAC value and append it to the designated message. Depending on the selected Pinpad Management System, the Pinpad may also insert other fields into the message. Note that the **ComputeMAC** method cannot be used while Pinpad input (PIN Entry) is enabled.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_DISABLED	A BeginEFTTransaction method has not been performed.
OPOS_E_BUSY	PINEntryEnabled is TRUE. The Pinpad cannot perform a MAC calculation during PIN Entry.
<i>Other Values</i>	See ResultCode .

EnablePINEntry Method

Syntax **LONG EnablePINEntry ();**

Remarks This method is called by the application to enable PIN Entry at the Pinpad device. When this method is called, the **PINEntryEnabled** property will be changed to TRUE. If the Pinpad uses pre-defined prompts for PIN Entry, then the value of the **Prompt** property will be changed to PPAD_MSG_ENTERPIN.

When the user has completed the PIN entry operation (either by entering their PIN or by hitting Cancel), the **PINEntryEnabled** property will be changed to FALSE. A **DataEvent** event will be fired to provide the encrypted PIN to the application when **DataEventEnabled** is set to TRUE. Note that any data entered at the Pinpad while **PINEntryEnabled** is TRUE will be supplied in encrypted form to this Control Object and will NOT be provided to any associated Keyboard Control Object.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_DISABLED	A BeginEFTTransaction method has not been performed.
<i>Other Values</i>	See ResultCode .

EndEFTTransaction Method

Syntax **LONG EndEFTTransaction (LONG CompletionCode);**

CompletionCode is one of the following values:

Value	Meaning
PPAD_EFT_NORMAL	The EFT transaction completed normally. Note that this does not mean that the EFT transaction was approved. It merely means that the proper sequence of messages was transmitted and received.
PPAD_EFT_ABNORMAL	The proper sequence of messages was not transmitted & received.

Remarks This method must be called by the application to inform the Pinpad Control of the end of an EFT Transaction. The Pinpad Control will perform termination functions (such as computing next transaction keys).

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
<i>Other Values</i>	See ResultCode .

UpdateKey Method

Syntax **LONG UpdateKey (LONG KeyNum, BSTR Key);**

Parameter	Description
<i>KeyNum</i>	A key number.
<i>Key</i>	A Hex-ASCII value for a new key.

Remarks This method is used to provide a new encryption key to the Pinpad. It is used only for those Pinpad Management Systems in which new key values are sent to the terminal as a field in standard messages from the EFT Transaction Host.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The specified key has been updated was successful.
OPOS_E_BUSY	The Pinpad cannot accept a new key at this time.
OPOS_E_ILLEGAL	One of the following conditions occurred: <ul style="list-style-type: none">• The selected Pinpad Management System does not support this function• <i>KeyNum</i> specifies an unacceptable key number.• <i>Key</i> contains a bad key (not Hex-ASCII or wrong length or bad parity).
<i>Other Values</i>	See ResultCode .

VerifyMAC Method

Syntax **LONG VerifyMAC (BSTR Message);**

Message contains a message received from an EFT Transaction Host.

Remarks This method is called by the application to have the Pinpad verify the MAC value in a message received from an EFT Transaction Host. This method returns TRUE if it can verify the message; otherwise, it returns FALSE. Note that the **VerifyMAC** method cannot be used while PIN Entry is enabled.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_DISABLED	A BeginEFTTransaction method has not been performed.
OPOS_E_BUSY	PINEntryEnabled is TRUE. The Pinpad cannot perform a MAC verification during PIN Entry.
<i>Other Values</i>	See ResultCode .

Events

DataEvent Event

Syntax **void DataEvent (LONG Status);**

The *Status* parameter is one of the following values:.

Value	Meaning
PPAD_SUCCESS	PIN Entry has occurred and values have been stored into the EncryptedPIN and AdditionalSecurityInformation properties.
PPAD_CANCEL	The user hit the cancel button on the Pinpad.
PPAD_TIMEOUT	A timeout condition occurred in the Pinpad. (Not all Pinpads will report this condition)

Remarks Fired to indicate the completion of a PIN Entry operation.

ErrorEvent Event

Syntax **void ErrorEvent (LONG ResultCode, LONG ResultCodeExtended, LONG ErrorLocus, LONG* pErrorResponse);**

Parameter	Description
<i>ResultCode</i>	Result code causing the error event. See values below.
<i>ResultCodeExtended</i>	Extended result code causing the error event. See values below.
<i>ErrorLocus</i>	Location of the error. See values below.
<i>pErrorResponse</i>	Pointer to the error event response. See values below.

The *ResultCode* parameter may be one of the following:

Value	Meaning
OPOS_E_EXTENDED	ResultCodeExtended = OPOS_EPPAD_BAD_KEY: An Encryption Key is corrupted or missing.
<i>Other Values</i>	See ResultCode .

The *ErrorLocus* parameter may be one of the following:

Value	Meaning
OPOS_EL_INPUT	Error occurred while gathering or processing event-driven input. No input data is available.

The contents at the location pointed to by the *pErrorResponse* parameter are preset to a default value, based on the *ErrorLocus*:

Value	Meaning
OPOS_ER_CLEAR	Clear the buffered input data. The error state is exited. Default when locus is OPOS_EL_INPUT.

Remarks Fired when an error is detected while trying to perform a PIN encryption function. The Pinpad service object may optionally provide more detailed diagnostic information via a **CheckHealth** or **DirectIO** mechanism.

CHAPTER 14

Point Card Reader Writer

Summary

Properties

<i>Common</i>	<i>Ver</i>	<i>Type</i>	<i>Access</i>	<i>May Use After</i>

General Information

The Point Card Reader Writer Control's OLE programmatic ID is "OPOS.PointCardRW".

This Device was added in OPOS Release 1.5.

Capabilities

The Point Card Reader Writer has the following capabilities:

- Supports reading and writing of the magnetic data of the point card is possible.
- Supports reading and writing of data from up to 6 tracks.
- The data on the tracks is in a device specific format, see the device manual for specific definition. The data is usually in ASCII format.
- Supports point cards with or without a printing area. Actual printing support depends upon the capabilities of the device.
- Supports both card insertion and ejection.
- There are no special security capabilities (e.g., encryption) supported.

Model

The general model of Point Card Reader Writer is shown.

The Point Card Reader Writer reads all the magnetic stripes on a point card. The data length and reading information are placed in the property corresponding to a track.

The Point Card Reader Writer follows the input model of event drive input during the card insertion process. Also, writing to the printing area and the magnetic stripe following the output model.

Input Model

- An application must call **Open** and **Claim** methods, then set the **DeviceEnabled** property to TRUE.
- When an application wants a card inserted, it calls the **BeginInsertion** method, specifying a timeout value.
- If a card is not inserted before the timeout period elapses, the Point Card Reader Writer returns an error.

- Even if a timeout occurs, the Point Card Reader Writer remains in insertion mode. If the application still wants a card inserted, it must call the **BeginInsertion** method again.
- To exit insertion mode, either after a card was inserted or the application wishes to abort insertion, the application calls the **EndInsertion** method.
- If there is a point card in the Point Card Reader Writer when **EndInsertion** is called, the point card's data tracks are automatically read and a **DataEvent** is enqueued. When the application sets the **DataEventEnabled** property to TRUE, the **DataEvent** will be delivered.
- If an error occurs while reading the point card's data tracks, an **ErrorEvent** is enqueued instead of a **DataEvent**. When the application sets the **DataEventEnabled** property to TRUE, the **ErrorEvent** will be delivered.
- The application can obtain the current number of enqueued data events by reading the **DataCount** property.
- All enqueued but undelivered input may be deleted by calling the **ClearInput** method.

Output Model

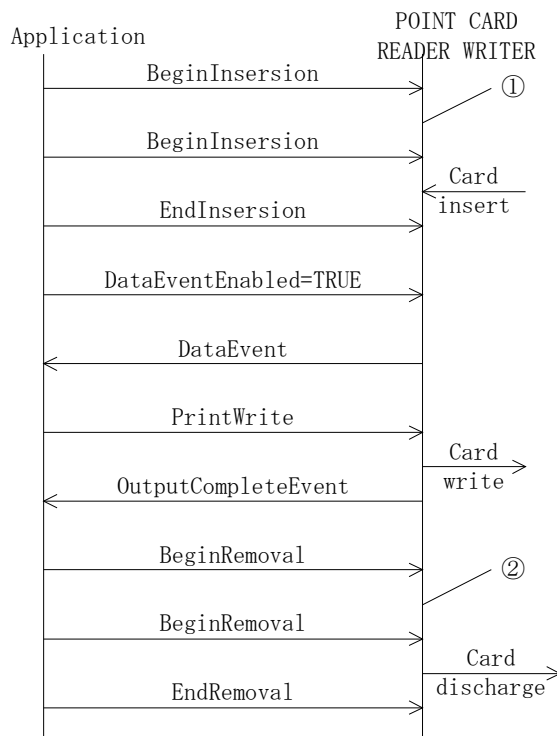

- To write data to a card, the application calls the **PrintWrite** method. The ability to write data depends upon the capabilities of the device.
- The **PrintWrite** method is always performed asynchronously. All asynchronous output is performed on a first-in, first-out basis.
- When the application calls **PrintWrite**, the Point Card Reader Writer assigns a unique identification number for this request. This ID is stored in the property **OutputID**. The Point Card Reader Writer then either queues the request or starts its processing. Either way the Point Card Reader Writer returns to the application quickly.
- When the **PrintWrite** method completes, an **OutputCompleteEvent** is delivered to the application. The **OutputID** associated with the completed request is passed in the **OutputCompleteEvent**.
- If the **PrintWrite** method fails during its processing, an **ErrorEvent** will be delivered to the application. If the application had multiple outstanding output requests, the **OutputID** of the request that failed can be determined by watching which requests have successfully completed by monitoring **OutputCompleteEvents**. The request that failed is the one that was issued immediately after the last request that successfully completed.

- All incomplete output requests may be deleted by calling the **ClearOutput** method. This method also stops any output that is in progress, if possible. No **OutputCompleteEvents** will be delivered for output requests terminated in this manner.
- When done accessing the point card, the application call the **BeginRemoval** method, specifying a timeout value.
- If the card is not removed before the timeout period elapses, the Point Card Reader Writer returns an error.
- Even if a timeout occurs, the Point Card Reader Writer remains in removal mode. If the application still wants the card removed, it must call the **BeginRemoval** method again.
- To exit removal mode, either after the card was physically removed or the application wishes to abort removal, the application calls the **EndRemoval** method.

Card Insertion Diagram

The processing from card insertion to card removal is shown below.

All the methods other than **PrintWrite** are performed synchronously.

- ① If the card is not inserted into the Point Card Reader Writer before the application specified timeout elapses, an error is returned. The application needs to call **BeginInserion** again to confirm that a point card has been inserted or call **EndInserion** to cancel the card insertion. After a successful **BeginInserion**, the application must call **EndInserion** to cause the Point Card Reader Writer to exit insertion mode and to read the magnetic stripe data from the point card.
- ② If the card is not removed from the Point Card Reader Writer before the application specified timeout elapses, an error is returned. The application needs to call **BeginRemoval** again to confirm that the point card has been removed, or call **EndRemoval** to cancel the card removal. After a successful **BeginRemoval**, the application must call **EndRemoval** to cause the Point Card Reader Writer to exit removal mode.

Printing Capability

- The Point Card Reader Writer supports devices that allow for rewriting the print area of a card.
- The Point Card Reader Writer supports printing specified either by dot units or by line units. When **CapPrintMode** is TRUE, the unit type is determined by the value of the **MapMode** property. When **CapPrintMode** is false, the unit type is defined as lines.
- The data to print is passed to the **PrintWrite** method as the *data* parameter. Special character modifications, such as double height, are dependent upon the capabilities of the device. The starting print location is specified by the *vposition* and *hposition* parameters respectively indicating the vertical and horizontal start position expressed in units defined by the **MapMode** property value.
- When using line units, the start position for lines containing both single and double high characters is the top of a single high character for horizontal printing and the bottom of all characters for vertical printing. See the diagram below for further clarification.

Horizontal writing

Vertical writing

Cleaning Capability

- Cleaning of the Point Card Reader Writer is necessary to prevent errors caused by dirt build up inside the device.
- A special cleaning card is used. There are two types of cleaning card: a wet card (such as a card wet with ethanol before use) and a dry card.
- Cleaning is carried out by having the inserted cleaning card make several passes over the reads heads inside the device.
- Some Point Card Reader Writers perform the cleaning operation by use of a switch on the device. Others perform the cleaning operation entire under control of the application.

Initialization of magnetic stripe data

- Some Point Card Reader Writers can initialize the magnetic stripe data to prevent the illegal use of a point card.
- There are three initialization techniques in use for Point Card Reader Writers:
 - ◆ Initialize all of the data, including the start sentinel, end sentinel and a correct LRC.
 - ◆ Write an application specific code into the data area using no sentinels.
 - ◆ Initialize all tracks to empty by just writing start and end sentinels.
- Initialization of the magnetic stripe is dependent upon the capability of the device.

Device Sharing

The Point Card Reader Writer is an exclusive-use device, as follows:

- The application must claim the device before enabling it.
- The application must claim and enable the device before accessing many Point Card Reader Writer specific properties.
- The application must claim and enable the device before calling methods that manipulate the device.
- See the “Summary” table for precise usage prerequisites.

Data Characters and Escape Sequences

The default character set of all Point Card Reader Writers is assumed to support at least the ASCII characters 20-hex through 7F-hex, which include spaces, digits, uppercase, lowercase, and some special characters. If the Point Card Reader Writer does not support lowercase characters, then the Service Object may translate them to uppercase.

Every escape sequence begins with the escape character ESC, whose value is 27 decimal, followed by a vertical bar ('|'). This is followed by zero or more digits and/or lowercase alphabetic characters. The escape sequence is terminated by an uppercase alphabetic character. Sequences that do not begin with ESC "|" are passed through to Point Card Reader Writer. Also, sequences that begin with ESC "|" but which are not valid OPOS escape sequences are passed through to Point Card Reader Writer.

To determine if escape sequences or data can be performed on Point Card Reader Writer, the application can call the **ValidateData** method. (For some escape sequences, corresponding capability properties can also be used.)

The following escape sequences are recognized. If an escape sequence specifies an operation that is not supported by the Point Card Reader Writer, then it is ignored.

Print Mode Characteristics that are remembered until explicitly changed.

<i>Name</i>	<i>Data</i>	<i>Remarks</i>
Font typeface selection	ESC #fT	Selects a new typeface for the following data. Values for the character '#' are: 0 = Default typeface. 1 = Select first typeface from the FontTypefaceList property. 2 = Select second typeface from the FontTypefaceList property. And so on.

Print Line Characteristics that are reset at the end of each print method or by a “Normal” sequence.

<i>Name</i>	<i>Data</i>	<i>Remarks</i>
Bold	ESC bC	Prints in bold or double-strike.
Underline	ESC #uC	Prints with underline. The character ‘#’ is replaced by an ASCII decimal string telling the thickness of the underline in printer dot units. If ‘#’ is omitted, then a printer-specific default width is used.
Italic	ESC iC	Prints in italics.
Reverse video	ESC rvC	Prints in a reverse video format.
Single high & wide	ESC 1C	Prints normal size.
Double wide	ESC 2C	Prints double-wide characters.
Double high	ESC 3C	Prints double-high characters.
Double high & wide	ESC 4C	Prints double-high/double-wide characters.
Scale horizontally	ESC #hC	Prints with the width scaled ‘#’ times the normal size, where ‘#’ is replaced by an ASCII decimal string.
Scale vertically	ESC #vC	Prints with the height scaled ‘#’ times the normal size, where ‘#’ is replaced by an ASCII decimal string.
Center	ESC cA	Aligns following text in the center.
Right justify	ESC rA	Aligns following text at the right.
Normal	ESC N	Restores printer characteristics to normal condition.

Properties

CapBold Property

Syntax	BOOL CapBold;
Remarks	If TRUE, then Point Card Reader Writer can print bold characters; otherwise it is FALSE. This property is initialized by the Open method.

CapCardEntranceSensor Property

Syntax	BOOL CapCardEntranceSensor;
Remarks	If TRUE, then Point Card Reader Writer has an entrance sensor; otherwise it is FALSE. This property is initialized by the Open method.

CapCharacterSet Property

Syntax **LONG CapCharacterSet;**

Remarks Holds the default character set capability. It may be one of the following:

Value	Meaning
PCRW_CCS_ALPHA	The default character set supports upper case alphabetic plus numeric, space, minus, and period.
PCRW_CCS_ASCII	The default character set supports all ASCII characters between 20-hex and 7F-hex.
PCRW_CCS_KANA	The default character set supports partial code page 932, including ASCII characters 20-hex through 7F-hex and the Japanese Kana characters A1-hex through DF-hex, but excluding the Japanese Kanji characters.
PCRW_CCS_KANJI	The default character set supports code page 932, including the Shift-JIS Kanji characters, Levels 1 and 2.
PCRW_CCS_UNICODE	The default character set supports UNICODE.

The default character set may contain a superset of these ranges. The initial **CharacterSet** property may be examined for additional information.

This property is initialized by the **Open** method.

CapCleanCard Property

Syntax **BOOL CapCleanCard;**

Remarks If TRUE, then the Point Card Reader Writer supports cleaning under application control, otherwise it is FALSE.

This property is initialized by the **Open** method.

CapClearPrint Property

Syntax **BOOL CapClearPrint;**

Remarks If TRUE, then the Point Card Reader Writer supports clearing (erasing) the printing area, otherwise it is FALSE.

This property is initialized by the **Open** method.

CapDhigh Property

Syntax **BOOL CapDhigh;**

Remarks If TRUE, then Point Card Reader Writer can print double high characters; FALSE if it cannot.

This property is initialized by the **Open** method.

CapDwide Property

Syntax **BOOL CapDwide;**

Remarks If TRUE, then Point Card Reader Writer can print double wide characters; FALSE if it cannot.

This property is initialized by the **Open** method.

CapDwideDhigh Property

Syntax **BOOL CapDwideDhigh;**

Remarks If TRUE, then Point Card Reader Writer can print double high / double wide characters; FALSE if it cannot.

This property is initialized by the **Open** method.

CapItalic Property

Syntax	BOOL CapItalic;
Remarks	If TRUE, then Point Card Reader Writer can print italic characters; FALSE if it cannot. This property is initialized by the Open method.

CapLeft90 Property

Syntax	BOOL CapLeft90;
Remarks	If TRUE, then Point Card Reader Writer can print in rotated 90 left mode; FALSE if it cannot. This property is initialized by the Open method.

CapPrint Property

Syntax	BOOL CapPrint;
Remarks	If TRUE, then Point Card Reader Writer has printing capability; Otherwise it is FALSE. This property is initialized by the Open method.

CapPrintMode Property

Syntax	BOOL CapPrintMode;
Remarks	If TRUE, then Point Card Reader Writer can designate a printing start position with the MapMode property; FALSE if it cannot. This property is initialized by the Open method.

CapRight90 Property

Syntax **BOOL CapRight90;**

Remarks If TRUE, then Point Card Reader Writer can print in a rotated 90° right mode;
FALSE if it cannot.

This property is initialized by the **Open** method.

CapRotate180 Property

Syntax **BOOL CapRotate180;**

Remarks If TRUE, then Point Card Reader Writer can print in a rotated upside down mode;
FALSE if it cannot.

This property is initialized by the **Open** method.

CapTracksToRead Property

Syntax **LONG CapTracksToRead;**

Remarks A bit mask indicating which magnetic tracks are accessible on the inserted point card. The value contained in this property is a bit wise OR of the constants PCRW_TRACK1 through PCRW_TRACK6.

For example, the access to track 1 is possible, when the bit is PCRW_TRACK1.

This property is initialized by the **Open** method.

Value	Meaning
PCRW_TRACK1	Track1
PCRW_TRACK2	Track2
PCRW_TRACK3	Track3
PCRW_TRACK4	Track4
PCRW_TRACK5	Track5
PCRW_TRACK6	Track6

CapTracksToWrite Property

Syntax **LONG CapTracksToWrite;**

Remarks A bit mask indicating which magnetic tracks are writable on the inserted point card. The value contained in this property is a bit wise OR of the constants PCRW_TRACK1 through PCRW_TRACK6.

For example, the access to track 1 is possible, when the bit is PCRW_TRACK1.

This property is initialized by the **Open** method.

Value	Meaning
PCRW_TRACK1	Track1
PCRW_TRACK2	Track2
PCRW_TRACK3	Track3
PCRW_TRACK4	Track4
PCRW_TRACK5	Track5
PCRW_TRACK6	Track6

CardState Property

Syntax **LONG CardState;**

Remarks If the **CapCardEntranceSensor** property is TRUE, the current card entrance sensor status is stored in this property. The value will be one of the following.

Value	Meaning
PCRW_STATE_NOCARD	No card or card sensor position indeterminate.
PCRW_STATE_REMAINING	Card remaining in an entrance.
PCRW_STATE_INRW	There is a card in the device.

PCRW_STATE_NOCARD is always set when the **CapCardEntranceSensor** property is FALSE.

See Also **CapCardEntranceSensor** Property

CharacterSet Property R/W**Syntax** **LONG CharacterSet;****Remarks** The character set for printing characters.

This property is initialized when the device is first enabled following the **Open** method.

Values are:

Value	Meaning
Range 101 - 199	Device-specific character sets that do not match a code page or the ASCII or Windows ANSI character sets.
Range 400 - 990	Code page; matches one of the standard values.
PCRW_CS_UNICODE	The character set supports UNICODE. The value of this constant is 997.
PCRW_CS_ASCII	The ASCII character set, supporting the ASCII characters between 0x20 and 0x7F. The value of this constant is 998.
PCRW_CS_WINDOWS	The Windows ANSI character set. The value of this constant is 999. This is exactly equivalent to the Windows code page 1252.
Range 1000 and higher	Windows code page; matches one of the standard values.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An invalid property value was used.
<i>Other Values</i>	See ResultCode .

See Also **CharacterSetList** Property

CharacterSetList Property

Syntax **BSTR CharacterSetList;**

Remarks A string of character set numbers.

This property is initialized by the **Open** method. The string consists of ASCII numeric set numbers separated by commas.

For example, if the string is “101,850,999”, then the device supports a device-specific character set, code page 850, and the Windows ANSI character set.

See Also **CharacterSet** Property

FontTypefaceList Property

Syntax **BSTR FontTypefaceList;**

Remarks A string that specifies the fonts and/or typefaces that are supported by Point Card Reader Writer.

This property is initialized by the **Open** method. The string consists of font or typeface names separated by commas. The application selects a font or typeface for the Point Card Reader Writer by using the font typeface selection escape sequence (ESC |#fT). The “#” character is replaced by the number of the font or typeface within the list: 1, 2, and so on.

In Japan, this property will frequently include the fonts “Mincho” and “Gothic”. Other fonts or typefaces may be commonly supported in other countries.

An empty string indicates that only the default typeface is supported.

See Also “Data Characters and Escape Sequences”

LineChars Property R/W

Syntax **LONG LineChars;**

Remarks The number of characters that may be printed on a line on the Point Card Reader Writer.

If changed to a line character width that can be supported, then the width is set to the specified value. If the exact width cannot be supported, then subsequent lines will be printed with a character size that most closely supports the specified characters per line. (For example, if set to 36 and the Point Card Reader Writer can print either 30 or 40 characters per line, then the Service Object should select the character size “40” and print up to 36 characters on each line.)

If the character width cannot be supported, then an error is returned. (For example, if set to 42 and Point Card Reader Writer can print either 30 or 40 characters per line, then the Service Object cannot support the request.)

Setting **LineChars** may also update **LineWidth**, **LineHeight**, and **LineSpacing**, since the character pitch or font may be changed.

The value of **LineChars** is initialized to the Point Card Reader Writer’s default line character width when the device is first enabled following the **Open** method.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An invalid line character width was specified.

See Also **LineCharsList** Property

LineCharsList Property

Syntax	BSTR LineCharsList;
Remarks	<p>A string containing the line character widths supported by the Point Card Reader Writer.</p> <p>This property is initialized by the Open method. The string consists of ASCII numeric set numbers separated by commas.</p> <p>For example, if the string is “32,36,40”, then the station supports line widths of 32, 36, and 40 characters.</p>
See Also	LineChars Property

LineHeight Property R/W

Syntax	LONG LineHeight;
Remarks	<p>The Point Card Reader Writer print line height. If the CapPrintMode property is TRUE, expressed in the unit of measure given by MapMode.</p> <p>If changed to a height that can be supported with the current character width, then the line height is set to this value. If the exact height cannot be supported, then the height is set to the closest supported value.</p> <p>When LineChars is changed, LineHeight is updated to the default line height for the selected width.</p> <p>The value of LineHeight is initialized to the Point Card Reader Writer’s default line height when the device is first enabled following the Open method.</p>
Return	When this property is set, the following value is placed in the ResultCode property:
Value	Meaning
OPOS_SUCCESS	The property was set successfully.

LineSpacing Property R/W

Syntax	LONG LineSpacing;
Remarks	<p>The spacing of each single-high print line, including both the printed line height plus the white space between each pair of lines. Depending upon Point Card Reader Writer and the current line spacing, a multi-high print line might exceed this value. If the CapPrintMode property is TRUE, line spacing is expressed in the unit of measure given by MapMode.</p> <p>If changed to a spacing that can be supported by Point Card Reader Writer, then the line spacing is set to this value. If the spacing cannot be supported, then the spacing is set to the closest supported value.</p> <p>When LineChars or LineHeight is changed, LineSpacing is updated to the default line spacing for the selected width or height.</p> <p>The value of LineSpacing is initialized to the Point Card Reader Writer's default line spacing when the device is first enabled following the Open method.</p>
Return	When this property is set, the following value is placed in the ResultCode property:
Value	Meaning
OPOS_SUCCESS	The property was set successfully.

LineWidth Property

Syntax	LONG LineWidth;
Remarks	<p>The width of a line of LineChars characters. If the CapPrintMode property is TRUE, expressed in the unit of measure given by MapMode.</p> <p>Setting LineChars may also update LineWidth.</p> <p>The value of LineWidth is initialized to the Point Card Reader Writer's default line width when the device is first enabled following the Open method.</p>

MapMode Property R/W

Syntax **LONG MapMode;**

Remarks Contains the mapping mode of the Point Card Reader Writer. The mapping mode defines the unit of measure used for other properties, such as line heights and line spacings.

The following map modes are supported:

Value	Meaning
PCRW_MM_DOTS	The Point Card Reader Writer's dot width. This width may be different for each Point Card Reader Writer.
PCRW_MM_TWIPS	1/1440 of an inch.
PCRW_MM_ENGLISH	0.001 inch.
PCRW_MM_METRIC	0.01 millimeter.

Setting **MapMode** may also change **LineHeight**, **LineSpacing** and **LineWidth**.

The value of **MapMode** is initialized to PCRW_MM_DOTS when the device is first enabled following the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An invalid mapping mode was specified.

MaxLine Property

Syntax	LONG MaxLine;
Remarks	<p>When the CapPrintMode property is FALSE MaxLine contains the maximum printable line number.</p> <p>In the case that there is a double-high character in the same line it relies on capability of a device.</p> <p>When the LineHeight property and/or the LineSpacing property change the MaxLine property may be renewed.</p>
See Also	LineHeight Property

PrintHeight Property

Syntax	LONG PrintHeight;
Remarks	<p>When the CapPrintMode property is TRUE, the height of largest character in the character set is stored in this property expressed in MapMode units.</p> <p>When the MapMode property is changed the value of the PrintHeight property changes.</p>
See Also	MapMode Property

ResultCodeExtended Property

Syntax **LONG ResultCodeExtended;**

Remarks When the **ResultCode** is set to OPOS_E_EXTENDED, this property is set to a class-specific value, and must match one of the values given in this document under the appropriate device class section.

When the **ResultCode** is set to any other value, this property may be set by the Service Object to any SO-specific value. These values are only meaningful if the application adds Service Object-specific code to handle them.

Value	Meaning
OPOS_EPCRW_READ	Reading is an error
OPOS_EPCRW_WRITE	Writing is an error
OPOS_EPCRW_JAM	Card was clogged
OPOS_EPCRW_MOTOR	Conveyance motor is an error
OPOS_EPCRW_COVER	Conveyance path cover opened
OPOS_EPCRW_PRINTER	Printer is an error
OPOS_EPCRW_RELEASE	Card is remaining in the entrance
OPOS_EPCRW_DISPLAY	Indicator is an error
OPOS_EPCRW_NOCARD	There is not a card in the reader

ReadState1 Property

Syntax **LONG ReadState1;**

Remarks The property is divided into four bytes with each byte containing status information about a track. The diagram below indicates how the property value is divided:

Control sets a value to this property immediately before it queues the **ErrorEvent** or **DataEvent**.

High Word		Low Word	
High Byte	Low Byte	High Byte	Low Byte
Track4	Track 3	Track 2	Track 1

The following value is set.

Value	Meaning
OPOS_SUCCESS	Normally it was written or the track is not permitted a writing.
OPOS_EPCRW_START	It is a start mark error.
OPOS_EPCRW_END	It is a end mark error.
OPOS_EPCRW_PARITY	It is a parity error.
OPOS_EPCRW_ENCODE	There is not encoding.
OPOS_EPCRW_LRC	It is a LRC error.
OPOS_EPCRW_VERIFY	It is a verify error.
OPOS_E_FAILURE	It is other error.

ReadState2 Property

Syntax **LONG ReadState2;**

Remarks The property is divided into four bytes with each byte containing status information about a track. The diagram below indicates how the property value is divided:

Control sets a value to this property immediately before it queues the **ErrorEvent** or **DataEvent**.

High Word		Low Word	
High Byte	Low Byte	High Byte	Low Byte
Unused	Unused	Track 6	Track 5

The following value is set.

Value	Meaning
OPOS_SUCCESS	Normally it was written or the track is not permitted a writing.
OPOS_EPCRW_START	It is a start mark error.
OPOS_EPCRW_END	It is a end mark error.
OPOS_EPCRW_PARITY	It is a parity error.
OPOS_EPCRW_ENCODE	There is not encoding.
OPOS_EPCRW_LRC	It is a LRC error.
OPOS_EPCRW_VERIFY	It is a verify error.
OPOS_E_FAILURE	It is other error.

RecvLength1 Property

Syntax **LONG RecvLength1**

Remarks The *Status* parameter is divided into four bytes with each of the bytes representing information about the six tracks. The diagram below indicates how the value is divided:

High Word		Low Word	
High Byte	Low Byte	High Byte	Low Byte
Track4	Track 3	Track 2	Track 1

A value of zero for a track byte means that no data was obtained from the swipe for that particular track. This might be due to the hardware device simply not having a read head for the track, or STX, ETX and LRC only was obtained from the swipe for that particular track, or reading of data without being made with some errors, or perhaps the application intentionally precluded incoming data from the track via the **TracksToRead** property.

A value greater than zero (> 0) indicates the length in bytes of the corresponding **TrackXData** property.

that the **TrackXData** properties are set up before a **DataEvent** is delivered here in these properties makes little sense to me.

RecvLength2 Property

Syntax **LONG RecvLength2**

Remarks The *Status* parameter is divided into four bytes with two of the bytes representing information about the six tracks, while the third and fourth bytes are unused. The diagram below indicates how the value is divided:

High Word		Low Word	
High Byte	Low Byte	High Byte	Low Byte
Unused	Unused	Track 6	Track 5

A value of zero for a track byte means that no data was obtained from the swipe for that particular track. This might be due to the hardware device simply not having a read head for the track, or STX,ETX and LRC only was obtained from the swipe for that particular track, or reading of data without being made with some errors, or perhaps the application intentionally precluded incoming data from the track via the **TracksToRead** property.

A value greater than zero (> 0) indicates the length in bytes of the corresponding **TrackXData** property.

that the **TrackXData** properties are set up before a **DataEvent** is delivered here in these properties makes little sense to me.

SidewaysMaxChars Property

Syntax	LONG SidewaysMaxChars;
Remarks	<p>Holds the maximum number of characters that may be printed on each line in sideways mode.</p> <p>If the capabilities CapLeft90 and CapRight90 are both FALSE, then SidewaysMaxChars is zero.</p> <p>Changing the properties LineHeight, LineSpacing, and LineChars may cause this property to change.</p> <p>This property is initialized by the Open method.</p>
See Also	SidewaysMaxLines Property

SidewaysMaxLines Property

Syntax	LONG SidewaysMaxLines;
Remarks	<p>Holds the maximum number of lines that may be printed in sideways mode.</p> <p>If the capabilities CapLeft90 and CapRight90 are both FALSE, then SidewaysMaxLines is zero.</p> <p>Changing the properties LineHeight, LineSpacing, and LineChars may cause this property to change.</p> <p>This property is initialized by the Open method.</p>
See Also	SidewaysMaxChars Property

TracksToRead Property R/W

Syntax **LONG TracksToRead;**

Remarks Holds the tracks that are to be read from the point card. It contains a bit wise OR of the constants PCRW_TRACK1 through PCRW_TRACK6. It may only contain values that are marked as allowable by the **CapTracksToRead** property. For example, to read to tracks 1, 2 and 3, the property would be set to PCRW_TRACK1 | PCRW_TRACK2 | PCRW_TRACK3.

This property is initialized when the device is first enabled following the **Open** method.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_BUSY	This operation cannot be performed because asynchronous output is in progress.
OPOS_E_ILLEGAL	An illegal track was defined. The Track is not available for writing. Refer to CapTracksToRead .
<i>Others</i>	See also to the item of ResultCode .

See Also **CapTracksToRead** Property

TracksToWrite Property R/W

Syntax **LONG TracksToWrite;**

Remarks Holds the tracks that are to be written to the point card. It contains a bit wise OR of the constants PCRW_TRACK1 through PCRW_TRACK6. It may only contain values that are marked as allowable by the **CapTracksToWrite** property. For example, to write to tracks 1, 2 and 3, the property would be set to PCRW_TRACK1 | PCRW_TRACK2 | PCRW_TRACK3.

This property is initialized when the device is first enabled following the Open method.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_BUSY	This operation cannot be performed because asynchronous output is in progress.
OPOS_E_ILLEGAL	An illegal track was defined. The Track is not available for writing. Refer to CapTracksToWrite .
<i>Others</i>	See also to the item of ResultCode .

See Also **CapTracksToWrite** Property; **PrintWrite** Method

Track1Data Property

Syntax **BSTR Track1Data;**

Remarks Contains the track 1 data from the point card.

This property contains track data between but not including the start and end sentinels.

An empty string indicates that the track was not accessible.

Track2Data Property

Syntax **BSTR Track2Data;**

Remarks Contains the track 2 data from the point card.

This property contains track data between but not including the start and end sentinels.

An empty string indicates that the track was not accessible.

Track3Data Property

Syntax **BSTR Track3Data;**

Remarks Contains the track 3 data from the point card.

This property contains track data between but not including the start and end sentinels.

An empty string indicates that the track was not accessible.

Track4Data Property

Syntax **BSTR Track4Data;**

Remarks Contains the track 4 data from the point card.

This property contains track data between but not including the start and end sentinels.

An empty string indicates that the track was not accessible.

Track5Data Property

Syntax **BSTR Track5Data;**

Remarks Contains the track 5 data from the point card.

This property contains track data between but not including the start and end sentinels.

An empty string indicates that the track was not accessible.

Track6Data Property

Syntax **BSTR Track6Data;**

Remarks Contains the track 6 data from the point card.

This property contains track data between but not including the start and end sentinels.

An empty string indicates that the track was not accessible.

WriteState1 Property

Syntax **LONG WriteState1;**

Remarks The property is divided into four bytes with each byte containing status information about a track. The diagram below indicates how the property is divided:

Control sets a value to this property immediately before it notifies the **ErrorEvent**.

High Word		Low Word	
High Byte	Low Byte	High Byte	Low Byte
Track4	Track 3	Track 2	Track 1

The following value is set.

Value	Meaning
OPOS_SUCCESS	Normally it was written or the track is not permitted a writing.
OPOS_EPCRW_START	It is a start sentinel error.
OPOS_EPCRW_END	It is a end sentinel error.
OPOS_EPCRW_PARITY	It is a parity error.
OPOS_EPCRW_ENCODE	There is no encoding.
OPOS_EPCRW_LRC	It is a LRC error.
OPOS_EPCRW_VERIFY	It is a verify error.
OPOS_E_FAILURE	It is other error.

WriteState2 Property

Syntax **LONG WriteState2;**

Remarks The property is divided into four bytes with each byte containing status information about a track. The diagram below indicates how the property is divided:

Control sets a value to this property immediately before it notifies the **ErrorEvent**.

High Word		Low Word	
High Byte	Low Byte	High Byte	Low Byte
Unused	Unused	Track 6	Track 5

The following value is set.

Value	Meaning
OPOS_SUCCESS	Normally it was written or the track is not permitted a writing.
OPOS_EPCRW_START	It is a start sentinel error.
OPOS_EPCRW_END	It is a end sentinel error.
OPOS_EPCRW_PARITY	It is a parity error.
OPOS_EPCRW_ENCODE	There is no encoding.
OPOS_EPCRW_LRC	It is a LRC error.
OPOS_EPCRW_VERIFY	It is a verify error.
OPOS_E_FAILURE	It is other error.

Write1Data Property R/W

Syntax **WSTR Write1Data;**

Remarks The **PrintWrite** method writes this data in track 1 of a point card.

This property contains track data between but not including the start and end sentinels.

Write2Data Property R/W

Syntax **WSTR Write2Data;**

Remarks The **PrintWrite** method writes this data in track 2 of a point card.

This property contains track data between but not including the start and end sentinels.

Write3Data Property R/W

Syntax **WSTR Write3Data;**

Remarks The **PrintWrite** method writes this data in track 3 of a point card.

This property contains track data between but not including the start and end sentinels.

Write4Data Property R/W

Syntax **WSTR Write4Data;**

Remarks The **PrintWrite** method writes this data in track 4 of a point card.

This property contains track data between but not including the start and end sentinels.

Write5Data Property R/W

Syntax **BSTR Write5Data;**

Remarks The **PrintWrite** method writes this data in track 5 of a point card.

This property contains track data between but not including the start and end sentinels.

Write6Data Property R/W

Syntax **BSTR Write6Data;**

Remarks The **PrintWrite** method writes this data in track 6 of a point card.

This property contains track data between but not including the start and end sentinels.

Methods

BeginInsertion Method

Syntax **LONG BeginInsertion (LONG Timeout);**

The *Timeout* parameter gives the number of milliseconds before failing the method. If zero, the method tries to begin insertion mode, then returns the appropriate status immediately.

If OPOS_FOREVER (-1), the method tries to begin insertion mode, then waits as long as needed until either the point card is inserted or an error occurs.

Remarks Called to initiate point card processing.

When called, the Point Card Reader Writer state is changed to allow the insertion of a point card and the point card insertion mode is entered. This method is paired with the **EndInsertion** method for controlling point card insertion.

If the Point Card Reader Writer device cannot be placed into insertion mode, an error is returned to the application. Otherwise, the Control continues to monitor point card insertion until either:

- The point card is successfully inserted. In this case, the Control returns an OPOS_SUCCESS status.
- The point card is not inserted before *Timeout* milliseconds have elapsed, or an error is reported by the Point Card Reader Writer device. In this case, the Control either returns OPOS_E_TIMEOUT or another error. The Point Card Reader Writer device remains in point card insertion mode. This allows an application to perform some user interaction and reissue the **BeginInsertion** method without altering the point card handling mechanism.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was initiated successfully.
OPOS_E_BUSY	This operation cannot be performed because asynchronous output is in progress.
OPOS_E_ILLEGAL	The Point Card Reader Writer does not exist or an invalid <i>Timeout</i> parameter was specified..
OPOS_E_TIMEOUT	The specified time has elapsed without the point card being properly inserted.
OPOS_E_EXTENDED	See ResultCodeExtended in Point Card Reader Writer
<i>Other Values</i>	See ResultCode .

See Also **EndInsertion** Method; **BeginRemoval** Method; **EndRemoval** Method

BeginRemoval Method

Syntax **LONG BeginRemoval (LONG *Timeout*);**

The *Timeout* property gives the number of milliseconds before failing the method. If zero, the method tries to begin removal mode, then returns the appropriate status immediately.

If OPOS_FOREVER (-1), the method tries to begin removal mode, then waits as long as needed until either the point card is ejected or an error occurs.

Remarks Called to initiate point card removal processing.

When called, the Point Card Reader Writer is made ready to eject a point card or activating a print card ejection mode. This method is paired with the **EndRemoval** method for controlling point card removal.

The type that has the sensor in the entrance ends normal with that a card is ejected from Point Card Reader Writer.

The type without the sensor ends normal with that ejection processing is implemented.

If the Point Card Reader Writer cannot be placed into removal or ejection mode, an error is returned to the application. Otherwise, the Control continues to monitor point card removal until either:

The point card is successfully ejected. In this case, the Control returns an OPOS_SUCCESS status.

The point card is not ejected before *Timeout* milliseconds have elapsed, or an error is reported by the Point Card Reader Writer. In this case, the Control either returns OPOS_E_TIMEOUT or another error. The Point Card Reader Writer remains in point card ejective mode. This allows an application to perform some user interaction and reissue the **BeginRemoval** method without altering the point card handling mechanism.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was initiated successfully.
OPOS_E_BUSY	This operation cannot be performed because asynchronous output is in progress.
OPOS_E_ILLEGAL	An invalid <i>Timeout</i> parameter was specified..

OPOS_E_TIMEOUT The specified time has elapsed without the point card being properly ejected.

OPOS_E_EXTENDED See **ResultCodeExtended** in Point Card Reader Writer

Other Values See **ResultCode**.

See Also **CapCardEntranceSensor** Property, **CardState** Property, **BeginInsertion** Method; **EndInsertion** Method; **EndRemoval** Method

CleanCard Method

Syntax **LONG CleanCard();**

Remarks This method is used to clean the read/write heads of the Point Card Reader Writer. This method is only supported if **CapCleanCard** property is TRUE.

Return This method is used to clear the printing area on a point card. This method is only supported, if the **CapCleanCard** property is TRUE.

Value	Meaning
OPOS_SUCCESS	The method was initiated successfully.
OPOS_E_ILLEGAL	There is no cleaning capability.
OPOS_E_EXTENDED	See ResultCodeExtended in Point Card Reader Writer
<i>Other Values</i>	See ResultCode .

See Also **CapCleanCard** Property

ClearPrintWrite Method

Syntax **LONG ClearPrintWrite (LONG Kind, LONG Hposition, LONG Vposition, LONG Width, LONG Height);**

Parameter	Description
<i>Kind</i>	Defines the parts of the point card that will be cleared. 1: Printing area 2: Magnetic tracks 3: Both printing area and magnetic tracks
<i>Hposition</i>	The horizontal start position for erasing the printing area. The value is in MapMode units if CapPrintMode is TRUE.
<i>Vposition</i>	The vertical start position for erasing the printing area. The value is in MapMode units if CapPrintMode is TRUE.
<i>Width</i>	The width used for erasing the printing area. The value is in MapMode units if CapPrintMode is TRUE.
<i>Height</i>	The height used for erasing the printing area. The value is in MapMode units if CapPrintMode is TRUE.

Remarks Used to erase the printing area of a point card and/or erase the magnetic track data on a point card.

When the **CapPrint** and **CapClearPrint** properties are both true, this method can be used to clear the printing area of a point card. The *Hposition*, *Vposition*, *Width*, and *Height* parameters define the rectangle that will be cleared. If these parameters are 0, 0, -1, -1 respectively, this method will erase the entire printing area.

The initialization of the magnetic track data relies upon the capability of the device.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was initiated successfully.
OPOS_E_ILLEGAL	The Point Card Reader Writer is not in point card removal mode.
OPOS_E_BUSY	This operation cannot be performed because asynchronous output is in progress.

OPOS_E_EXTENDED See **ResultCodeExtended** in Point Card Reader Writer

Other Values See **ResultCode**.

See Also **CapClearPrint** Property, **CapPrint** Property

EndInsertion Method

Syntax **LONG EndInsertion ();**

Remarks Called to end point card insertion processing.

When called, the Point Card Reader Writer is taken out of point card insertion mode. If a point card is detected in the device, a successful status of OPOS_SUCCESS is returned to the application. If no point card is present, an extended error status OPOS_EPCRW_NOCARD is returned.

This method is paired with the **BeginInsertion** method for controlling point card insertion.

Return One of the following values is returned by the method and placed in the ResultCode property:

Value	Meaning
OPOS_SUCCESS	The method was initiated successfully.
OPOS_E_ILLEGAL	The Point Card Reader Writer is not in point card insertion mode.
OPOS_E_FAILURE	A card is not included in Point Card Reader Writer.
OPOS_E_EXTENDED	See ResultCodeExtended in Point Card Reader Writer
<i>Other Values</i>	See ResultCode .

See Also **BeginInsertion** Property, **BeginRemoval** Property, **EndRemoval** Property

EndRemoval Method

Syntax **LONG EndRemoval ();**

Remarks Called to end point card removal processing.

When called, the Point Card Reader Writer is taken out of point card removal or ejection mode. If no point card is detected in the device, a successful status of OPOS_SUCCESS is returned to the application. If a point card is present, an extended error status OPOS_EPCRW_RELEASE is returned.

This method is paired with the **BeginRemoval** method for controlling point card removal.

The application may choose to call this method immediately after a successful **BeginRemoval** if it wants to use the Point Card Reader Writer sensors to determine when the point card has been ejected. Alternatively, the application may prompt the user and wait for a key press before calling this method.

Return One of the following values is returned by the method and placed in the ResultCode property:

Value	Meaning
OPOS_SUCCESS	The method was initiated successfully.
OPOS_E_ILLEGAL	The Point Card Reader Writer is not in point card removal mode.
OPOS_E_FAILURE	There is a card in Point Card Reader Writer.
OPOS_E_EXTENDED	See ResultCodeExtended in Point Card Reader Writer
<i>Other Values</i>	See ResultCode .

See Also **BeginInsertion** Property, **EndInsertion** Property, **BeginRemoval** Property

PrintWrite Method

Syntax **LONG PrintWrite (LONG Kind, LONG Hposition, LONG Vposition, BSTR Data);**

Parameter	Description
<i>Kind</i>	Designates the effect of the point card. 1: Printing area 2: Magnetic tracks 3 : Both printing area and magnetic tracks
<i>Hposition</i>	The horizontal start position for printing. The value is in MapMode units if CapPrintMode is TRUE.
<i>Vposition</i>	The vertical start position for printing. The value is in MapMode units if CapPrintMode is TRUE.
<i>Data</i>	The data to be printed. Any escape sequences in the data are dependent upon the capabilities of the device. The format of this data depends upon the value of the BinaryConversion property.

Remarks This method will either print the specified data on the printing area of the point card, write data from the **WriteXData** properties to the magnetic tracks, or both. In order to print on a point card the **CapPrint** property must be true. In order to write the magnetic tracks on a point card, the **WriteXData** properties for each desired tracks must be set to the desired value, the **TracksToWrite** property must be set to a bitmask indicating which tracks to write (see **TracksToWrite** for a complete description) and the **CapTracksToWrite** property must indicate that each tracks specified in **TracksToWrite** is legal.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was initiated successfully.
OPOS_E_ILLEGAL	The Point Card Reader Writer is not in point card ejective mode.
OPOS_E_EXTENDED	See ResultCodeExtended in Point Card Reader Writer
<i>Other Values</i>	See ResultCode .

See Also **CapTracksToWrite** Property, **CapPrint** Property, **CapPrintMode** Property,
WriteXData Properties, **TracksToWrite** Property

RotatePrint Method

Syntax **LONG RotatePrint (LONG Rotation);**

Parameter	Description
<i>Rotation</i>	Direction of rotation. See values below.
Value	Meaning
PCRW_RP_RIGHT90	Rotate printing 90° to the right (clockwise).
PCRW_RP_LEFT90	Rotate printing 90° to the left (counter-clockwise).
PCRW_RP_ROTATE180	Rotate printing 180°, that is, print upside-down.
PCRW_RP_NORMAL	End rotated printing.

Remarks Enters or exits rotated print mode.

The **RotatePrint** method designates the rotation of the printing area. After calling this method, the application calls the **PrintWrite** method and the print data is printed in the direction specified by the **RotatePrint** call. If *Rotation* is PCRW_RP_NORMAL, then rotated print mode is exited.

Changing the rotation mode may also change the Point Card Reader Writer's line height, line spacing, line width, and other metrics.

Return One of the values in the following table is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	The Point Card Reader Writer does not support the specified rotation.
OPOS_E_BUSY	This operation cannot be performed because asynchronous output is in progress.
OPOS_E_EXTENDED	See ResultCodeExtended in Point Card Reader Writer
<i>Other Values</i>	See ResultCode .

See Also "Data Characters and Escape Sequences"

ValidateData Method**Syntax** **LONG ValidateData(BSTR Data);**

Parameter	Description
<i>Data</i>	The data to be validated. May include printable data and escape sequences. The format of this data depends upon the value of the BinaryConversion property.

Remarks Call to determine whether a data sequence, possibly including one or more escape sequences, is valid for the specified station, before calling the **PrintWrite** method.

This method does not cause any printing, but is used to determine the capabilities of the Point Card Reader Writer.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The data is valid.
OPOS_E_ILLEGAL	Some of data is not precisely supported by the Point Card Reader Writer, but the Control can select valid alternatives.
OPOS_E_FAILURE	Some of the data is not supported. No alternatives can be selected.

Cases which cause OPOS_E_ILLEGAL to be returned are:

Escape Sequence	Condition
Underline	The thickness '#' is not precisely supported: Control will select the closest supported value.
Shading	The percentage '#' is not precisely supported: Control will select the closest supported value.
Scale horizontally	The scaling factor '#' is not supported: Control will select the closest supported value.
Scale vertically	The scaling factor '#' is not supported: Control will select the closest supported value.

Cases which will cause OPOS_E_FAILURE to be returned are:

Escape Sequence	Condition
(General)	The escape sequence format is not valid.
Font typeface	The typeface ‘#’ is not supported.
Bold	Not supported.
Underline	Not supported.
Italic	Not supported.
Reverse video	Not supported.

Events

DataEvent Event

Syntax	void DataEvent (LONG <i>Status</i>); The <i>Status</i> parameter contains zero.
Remarks	Fired to present input data from the device to the application. The point card data is placed in each property before this event is delivered.

ErrorEvent Event

Syntax **void ErrorEvent**(**LONG** *ResultCode*, **LONG** *ResultCodeExtended*, **LONG** *ErrorLocus*, **LONG*** *pErrorResponse*);

Value	Meaning
<i>ResultCode</i>	The code which caused the error event. Remarks ResultCode for the value.
<i>ResultCodeExtended</i>	The extended code which caused the error event. Remarks the value below for the value. See ResultCodeExtended .
<i>ErrorLocus</i>	Location of the error. See values below.
<i>pErrorResponse</i>	Pointer to the error event response. See values below.

The *ErrorLocus* parameter may be one of the following:

Value	Meaning
OPOS_EL_OUTPUT	Error occurred while processing asynchronous output.
OPOS_EL_INPUT	Error occurred while gathering or processing event-driven input. No input data is available.
OPOS_EL_INPUT_DATA	Error occurred while gathering or processing event-driven input, and some previously buffered data is available.

The contents at the location pointed to by the *pErrorResponse* parameter are preset to a default value, based on the *ErrorLocus*. The application may change them to one of the following:

Value	Meaning
OPOS_ER_RETRY	Typically valid only when locus is OPOS_EL_OUTPUT. Retry the asynchronous output. The error state is exited. May be valid when locus is OPOS_EL_INPUT. Default when locus is OPOS_EL_OUTPUT.
OPOS_ER_CLEAR	Clear the asynchronous output or buffered input data. The error state is exited. Default when locus is OPOS_EL_INPUT.
OPOS_ER_CONTINUEINPUT	Use only when locus is OPOS_EL_INPUT_DATA. Acknowledges the error and directs the Control to continue

processing. The Control remains in the error state and will deliver additional **DataEvents** as directed by the **DataEventEnabled** property. When all input has been delivered and the **DataEventEnabled** property is again set to TRUE, then another **ErrorEvent** is delivered with locus OPOS_EL_INPUT.
Default when locus is OPOS_EL_INPUT_DATA.

- Remarks** Fired when an error is detected while processing an asynchronous PrintWrite method. The control's State transitions into the error state.
- Input error events are not delivered until the **DataEventEnabled** property is TRUE, so that proper application sequencing occurs.
- The error information data is placed in **ReadStateX** properties before this event is delivered.
- Data length is set 0 to the **TrackLengthX** property.
- The null data is stored in the **TrackXData** property.
- If there is abnormality in the track of a/the point card at the **PrintWrite**, error information is set in **WriteStateX** property before this event is delivered.
- See Also** "Status, Result Code, and State Model", **ReadStateX** Property, **TrackLengthX** Property, **TrackXData** Property, **WriteStateX** Property

StatusUpdateEvent Event

Syntax **void StatusUpdateEvent(LONG Status);**

Remarks Fired when the entrance sensor status of the Point Card Reader Writer changes.

If the **CapCardEntranceSensor** is FALSE, then the device does not support status reporting, then this event will never be fired to report card insertion state changes.

The *Status* parameter may be one of the following:

Value	Meaning
PCRW_SUE_NOCARD	No card or card sensor position indeterminate.
PCRW_SUE_REMAINING	Card remaining in entrance.
PCRW_SUE_INRW	There is a card in the device.

Power reporting StatusUpdateEvent values

See **StatusUpdateEvent** description on page 74

StatusUpdateEvent	1.3	Open, Claim, & Enable

General Information

The POS Keyboard Control's OLE programmatic ID is "OPOS.POSKeyboard".

This device was added in OPOS Release 1.1.

Capabilities

The POS Keyboard Control has the following capability:

- Reads keys from a POS keyboard. A POS keyboard may be an auxiliary keyboard, or it may be a virtual keyboard consisting of some or all of the keys on the system keyboard.⁸

Model

The POS Keyboard Control follows the general "Input Model" for event-driven input:

- When input is received by the Control, it enqueues a **DataEvent**.
- If the **AutoDisable** property is TRUE, then the control automatically disables itself when a **DataEvent** is enqueued.
- An enqueued **DataEvent** can be delivered to the application when the **DataEventEnabled** property is TRUE. Just before delivering this event, the Control copies the data into properties, and disables further data events by setting the **DataEventEnabled** property to FALSE. This causes subsequent input data to be enqueued by the Control while the application processes the current input and associated properties. When the application has finished the current input and is ready for more data, it reenables events by setting **DataEventEnabled** to TRUE.
- An **ErrorEvent** (or events) are enqueued if the Control encounters an error while gathering or processing input, and is delivered to the application when the **DataEventEnabled** property is TRUE.
- The **DataCount** property may be read to obtain the number of **DataEvents** enqueued by the Control.
- All input enqueued by the Control may be deleted by calling the **ClearInput** method.

⁸ OPOS 1.1 defined a POS Keyboard as a secondary key entry device, separate from the primary keyboard. OPOS 1.2 expanded this definition.

Keyboard Translation

The POS Keyboard Control must supply a mechanism for translating its internal key codes into user-defined codes which are returned by the data events. Note that this translation ***must*** be end-user configurable.

Device Sharing

The POS keyboard is an exclusive-use device, as follows:

- The application must claim the device before enabling it.
- The application must claim and enable the device before the device begins reading input.
- See the “Summary” table for precise usage prerequisites.

Properties

CapKeyUp Property

Added in Release 1.2

Syntax **BOOL CapKeyUp;**

Remarks If TRUE, then the Control is able to generate both key down and key up events, depending upon the setting of the **EventTypes**.

If FALSE, then the Control is only able to generate the key down event.

EventTypes Property R/W

Added in Release 1.2

Syntax **LONG EventTypes;**

Remarks Select the type of events that the application wants to receive.

Values are:

Value	Meaning
KBD_ET_DOWN	Generate key down events.
KBD_ET_DOWN_UP	Generate key down and key up events.

Release 1.1: Only key down events can be delivered.

Release 1.2 and later: Key down and key up events can be delivered.

This property is initialized to KBD_ET_DOWN by the **Open** method.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An invalid property value was used, or the Control does not support the selected value.

POSKeyData Property

Syntax **LONG POSKeyData;**

Remarks The value of the key from the last **DataEvent**.

The Application may treat this value as device independent, assuming that the system installer has configured the POSKeyboard Service Object to translate internal key codes to the codes expected by the Application. Such configuration is inherently Service Object-specific.

Release 1.1: **POSKeyData** was defined as a logical key code in the upper 16 bits and a scan code in the lower 16 bits, where the values need not match a standard PC keyboard's values.

Release 1.2 and later: Added the requirement for an end-user configurable translation into arbitrary keycodes.

This property is set by the Control just before delivering the **DataEvent**.

POSKeyEventType Property *Added in Release 1.2*

Syntax **LONG POSKeyEventType;**

Remarks This property holds the type of the last keyboard event: Is the key being pressed or released?

Values are:

Value	Meaning
KBD_KET_KEYDOWN	The key in POSKeyData was pressed.
KBD_KET_KEYUP	The key in POSKeyData was released.

This property is set by the Control just before delivering the **DataEvent**.

Events

DataEvent Event

Syntax **void DataEvent (LONG Status);**

The *Status* parameter contains zero.

Remarks Fired to present input data from the device to the application. The logical key number is placed in the **POSKeyData** property and the event type is placed in the **POSKeyEventType** property before this event is delivered.

ErrorEvent Event

Syntax **void ErrorEvent (LONG ResultCode, LONG ResultCodeExtended, LONG ErrorLocus, LONG* pErrorResponse);**

Parameter	Description
<i>ResultCode</i>	Result code causing the error event. See ResultCode for values.
<i>ResultCodeExtended</i>	Extended result code causing the error event. See ResultCodeExtended for values.
<i>ErrorLocus</i>	Location of the error. See values below.
<i>pErrorResponse</i>	Pointer to the error event response. See values below.

The *ErrorLocus* parameter may be one of the following:

Value	Meaning
OPOS_EL_INPUT	Error occurred while gathering or processing event-driven input. No input data is available.
OPOS_EL_INPUT_DATA	Error occurred while gathering or processing event-driven input, and some previously buffered data is available.

The contents at the location pointed to by the *pErrorResponse* parameter is preset to a default value, based on the *ErrorLocus*. The application may change it to one of the following:

Value	Meaning
OPOS_ER_CLEAR	Clear the buffered input data. The error state is exited. Default when locus is OPOS_EL_INPUT.
OPOS_ER_CONTINUEINPUT	Use only when locus is OPOS_EL_INPUT_DATA. Acknowledges the error and directs the Control to continue processing. The Control remains in the error state and will deliver additional DataEvents as directed by the DataEventEnabled property. When all input has been delivered and the DataEventEnabled property is again set to TRUE, then another ErrorEvent is delivered with locus OPOS_EL_INPUT. Default when locus is OPOS_EL_INPUT_DATA.

- Remarks** Fired when an error is detected while trying to read POS Keyboard data.
- Input error events are not delivered until the **DataEventEnabled** property is TRUE, so that proper application sequencing occurs.
- See Also** “Status, Result Code, and State Model”

CHAPTER 16

POS Power

Summary

Properties

<i>Common</i>	<i>Ver</i>	<i>Type</i>	<i>Access</i>	<i>May Use After</i>
AutoDisable	1.5	Boolean	R/W	<i>Not Supported</i>
BinaryConversion	1.5	Long	R/W	Open
CapPowerReporting	1.5	Long	R	Open

OutputCompleteEvent	1.5	<i>Not supported</i>
StatusUpdateEvent	1.5	Open & Enable

General Information

The POSPower OLE programmatic ID is “OPOS.POSPower”.

This device was added on OPOS Release 1.5.

Capabilities

The POSPower device class has the following capabilities:

- Supports a command to “shut down” the system.
- Supports accessing a power handling mechanism of the underlying operating system and hardware.
- Informs the application if a power fail situation has occurred.
- Informs the application if the UPS charge state has changed.
- Informs the application about high CPU temperature.
- Informs the application about stopped CPU fan.
- Informs the application if an operating system dependant enforced shutdown mechanism is processed.
- Allows the application after saving application data locally or transferring application data to a server to shut down the POS terminal.
- Informs the application about an initiated shutdown.

Device Sharing

The POSPower is a sharable device. Its device sharing rules are:

- After opening and enabling the device, the application may access all properties and methods and will receive status update events.
- If more than one application has opened and enabled the device, all applications may access its properties and methods. Status update events are fired to all of the applications.
- If one application claims the POSPower, then only that application may call the ShutdownPOS method. This feature provides a degree of security, such that these methods may effectively be restricted to the main POS application if that application claims the device at startup.
- See the “Summary” table for precise usage prerequisites.

Model

The general model of POSPower is based on the power model of each device in version 1.3 or later. The same common properties are used but all states relate to the POS terminal itself and not to a peripheral device.

There are three states of the POSPower :

- **ONLINE.** The POS terminal is powered on and ready for use. This is the “operational” state.
- **OFF.** The POS terminal is powered off or detached from the power supplying net. The POS terminal runs on battery power support. This is the powerfail situation.
- **OFFLINE.** The POS terminal is powered on but is running in a "lower-power-consumption" mode. It may need to be placed online by pressing a button or a key or something else which may wake up the system.

Power reporting only occurs while the device is open, enabled and power notification is switched on.

In a powerfail situation - that means the POSPower is in the state OFF - the POS terminal will be shut down automatically after the last application has closed the POSPower device or the time specified by the *EnforcedShutdownDelayTime* has been elapsed.

A call to the *ShutdownPOS* method will always shut down the POS terminal independent of the system power state.

Properties

CapFanAlarm Property

Syntax	BOOL CapFanAlarm;
Remarks	If TRUE the device is able to detect whether the CPU fan is stopped. Otherwise it is FALSE. This property is initialized by the Open method.

CapHeatAlarm Property

Syntax	BOOL CapHeatAlarm;
Remarks	If TRUE the device is able to detect whether the CPU is running at too high of a temperature. Otherwise it is FALSE. This property is initialized by the Open method.

CapQuickCharge Property

Syntax	BOOL CapQuickCharge;
Remarks	If TRUE, power management allows to charge the battery in a quick method. The time for charging the battery is shorter than usual. Otherwise it is FALSE. This property is initialized by the Open method.
See Also	QuickChargeMode Property, QuickChargeTime Property

CapShutdownPOS Property

- Syntax** **BOOL CapShutdownPOS;**
- Remarks** If TRUE the device is able to explicitly shut down the POS. Otherwise it is FALSE.
This property is initialized by the Open method.
- See Also** **ShutdownPOS Method**

CapUPSChargeState Property

- Syntax** **LONG CapUPSChargeState;**
- Remarks** If not equal to zero, the UPS can deliver one or more charge states. It can contain any of the following values logically ORed together.
- | Value | Meaning |
|------------------|---|
| PWR_UPS_FULL | UPS battery is near full charge. |
| PWR_UPS_WARNING | UPS battery is near 50% charge. |
| PWR_UPS_LOW | UPS battery is near empty. Application shutdown should be started to ensure that it can be completed before the battery charge is depleted. A minimum of 2 minutes of normal system operation can be assumed when this state is entered unless this is the first charge state reported upon entering the "Off" power state. |
| PWR_UPS_CRITICAL | UPS battery is in a critical state and could be disconnected at any time without further warnings. |
- This property is initialized by the **Open** method.
- See Also** **UPSChargeState Property**

EnforcedShutdownDelayTime Property R/W

Syntax **LONG EnforcedShutdownDelayTime;**

Remarks If not equal to zero, the system has a built-in mechanism to shut down the POS terminal after a determined time in a power fail situation. This property contains the time in milliseconds when the system will shut down automatically after a power failure. A power failure is the situation when the POS terminal is powered off or detached from the power supplying net and runs on battery power support.

If zero no automatic shutdown is performed and the application has to call itself the ShutdownPOS method.

Applications will be informed about an initiated automatic shutdown.

This property is initialized by the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An illegal value was specified.

See Also **ShutdownPOS Method**

PowerFailDelayTime Property

Syntax **LONG PowerFailDelayTime;**

Remarks This property contains the time in milliseconds for power fail intervals which will not create a power fail situation. In some countries the power has sometimes short intervals where the power supply is interrupted. Those short intervals are in the range of milliseconds up to a few seconds and are handled by batteries or other electric equipment and should not cause a power fail situation. The power fail interval starts when the POS terminal is powered off or detached from the power supplying net and runs on battery power support. The power fail interval ends when the POS terminal is again powered on and attached to the power supplying net. However, if the power fail interval is longer than the time specified in the PowerFailDelayTime property a power fail situation is created.

Usually this parameter is a configuration parameter of the underlying power management. So, the application can only read this property.

This property is initialized by the **Open** method.

QuickChargeMode Property

Syntax **BOOL QuickChargeMode;**

Remarks If TRUE, the battery is being recharged in a quick charge mode.

If FALSE, it is being charged in a normal mode.

This property is only set if **CapQuickCharge** is TRUE.

See Also **CapQuickCharge** Property, **QuickChargeTime** Property

QuickChargeTime Property

- Syntax** **LONG QuickChargeTime;**
- Remarks** This time specifies the remaining time for loading the battery in quickcharge mode. After the time has elapsed, the battery loading mechanism of power management usually switches into the normal mode.
- The time is specified in milliseconds.
- This property is only set if **CapQuickCharge** is TRUE.
- See Also** **QuickChargeMode** Property, **CapQuickCharge** Property

UPSChargeState Property

- Syntax** **LONG UPSChargeState;**
- Remarks** This property holds the actual UPS charge state.
- This property is initialized and kept current while the device is enabled.
- Return** One of the following values is returned:
- | Value | Meaning |
|------------------|---|
| PWR_UPS_FULL | UPS battery is near full charge. |
| PWR_UPS_WARNING | UPS battery is near 50% charge. |
| PWR_UPS_LOW | UPS battery is near empty. Application shutdown should be started to ensure that it can be completed before the battery charge is depleted. A minimum of 2 minutes of normal system operation can be assumed when this state is entered unless this is the first charge state reported upon entering the "Off" power state. |
| PWR_UPS_CRITICAL | UPS battery is in a critical state and could be disconnected at any time without further warning. |
- See Also** **CapUPSChargeState** Property

Methods

ShutdownPOS Method

Syntax **LONG ShutdownPOS();**

Remarks Call to shut down the POS terminal. This method will always shut down the system independent of the system power state.
If the POSPower is claimed only the application which claimed the device is able to shut down the POS terminal.
Applications will be informed about an initiated shutdown.
It is recommended that in a power fail situation an application has to call this method after saving all data and setting the application to a defined state.
If the **EnforcedShutdownDelayTime** property specifies a time greater then zero and the application did not call the **ShutdownPOS** method within the time specified in **EnforcedShutdownDelayTime**, the system will be shut down automatically. This mechanism may be provided by an underlying operating system to prevent the battery from beeing emptied before the system is shut down.
This method is only supported if **CapShutdownPOS** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The shutdown is initiated.
OPOS_E_ILLEGAL	This method is not supported
<i>Other Values</i>	See ResultCode .

Events

StatusUpdate Event

Syntax **void StatusUpdateEvent (LONG Status);**

The *Status* parameter contains the updated power status or an alarm status.

One of the following values may be returned:

Value	Meaning
PWR_SUE_UPS_FULL	UPS battery is near full charge. This can be returned if CapUPSChargeState contains PWR_UPS_FULL.
PWR_SUE_UPS_WARNING	UPS battery is near 50% charge. This can be returned if CapUPSChargeState contains PWR_UPS_WARNING.
PWR_SUE_UPS_LOW	UPS battery is near empty. Application shutdown should be started to ensure that it can be completed before the battery charge is depleted. A minimum of 2 minutes of normal system operation can be assumed when this state is entered unless this is the first charge state reported upon entering the "Off" power state. This can be returned if CapUPSChargeState contains PWR_UPS_LOW.
PWR_SUE_UPS_CRITICAL	UPS is in critical state, and will in short time be disconnected. This can be returned if CapUPSChargeState contains PWR_UPS_CRITICAL.
PWR_SUE_FAN_STOPPED	The CPU fan is stopped. This can be returned if CapFanAlarm is TRUE.
PWR_SUE_FAN_RUNNING	The CPU fan is running. This can be returned if CapFanAlarm is TRUE.
PWR_SUE_TEMPERATURE_HIGH	The CPU is running on high temperature. This can be returned if CapHeatAlarm is TRUE.
PWR_SUE_TEMPERATURE_OK	The CPU is running on normal temperature. This can be returned if CapHeatAlarm is TRUE.

PWR_SUE_SHUTDOWN The system will be shut down immediately.

Power reporting StatusUpdateEvent values

See **StatusUpdateEvent** description.

Remarks Delivered when a **UPSCheckState** change or an alarm situation occurs.

See Also **CapFanAlarm, CapHeatAlarm, CapUPSCheckState** and **UPSCheckState**

General Information

The POS Printer Control's OLE programmatic ID is "OPOS.POSPrinter".

The printer OLE Control does not attempt to encapsulate the generic Windows graphics printer. Rather, for performance and ease of use considerations, the interfaces are defined to directly control a printer. Usually, an application will print one line to one station per method, for ease of use and accuracy in recovering from errors.

The printer model defines three stations with the following general uses:

- **Journal** Used for simple text to log transaction and activity information. Kept by the store for audit and other purposes.
- **Receipt** Used to print transaction information. Usually given to the customer. Also often used for store reports. Contains either a knife to cut the paper between transactions, or a tear bar to manually cut the paper.
- **Slip** Used to print information on a form. Usually given to the customer. Also used to print "validation" information on a form. The form type is typically a check or credit card slip.

Sometimes, limited forms-handling capability is integrated with the receipt or journal station to permit validation printing. Often this limits the number of print lines, due to the station's forms-handling throat depth. The Printer Control nevertheless addresses this printer functionality as a slip station.

Capabilities

The POS printer has the following capability:

- The default character set can print the ASCII characters 0x20 through 0x7F, which includes space, digits, uppercase, lowercase, and some special characters. (If the printer does not support all of these, then it should translate them to close approximations – such as lowercase to uppercase.)

The POS printer may have several additional capabilities. See the capabilities properties for specific information.

The following capabilities are not addressed in this version of the OPOS specification. A Service Object may choose to support them through the **DirectIO** mechanism.

- Downloadable character sets.
- Character substitution.
- General graphics printing, where each pixel of the printer line may be specified.

Model

The POS Printer follows the general output model, with some enhancements:

- The following methods are always performed synchronously: **BeginInsertion**, **EndInsertion**, **BeginRemoval**, **EndRemoval**, **ChangePrintSide** and **CheckHealth**. These methods will fail if asynchronous output is outstanding.
- The following method is also always performed synchronously: **PrintImmediate**. This method tries to print its data immediately (that is, as the very next printer operation). It may be called when asynchronous output is outstanding. **PrintImmediate** is primarily intended for use in exception conditions when asynchronous output is outstanding.
- The following methods are performed either synchronously or asynchronously, depending on the value of the **AsyncMode** property: **PrintNormal**, **PrintTwoNormal**, **CutPaper**, **RotatePrint**, **PrintBarCode**, **PrintBitmap**, **TransactionPrint** and **MarkFeed**. When **AsyncMode** is FALSE, then these methods print synchronously and return their completion status to the application.
- When **AsyncMode** is TRUE, then these methods operate as follows:
 - ◆ The Control buffers the request, sets the **OutputID** property to an identifier for this request, and returns as soon as possible. When the device completes the request successfully, then the Control fires an **OutputCompleteEvent**. A parameter of this event contains the **OutputID** of the completed request.

Asynchronous printer methods will not return an error status due to a printing problem, such as out of paper or printer fault. These errors will only be reported by an **ErrorEvent**. An error status is returned only if the printer is not claimed and enabled, a parameter is invalid, or the request cannot be enqueued. The first two error cases are due to an application error, while the last is a serious system resource exception.

- ◆ If an error occurs while performing an asynchronous request, an **ErrorEvent** is enqueued and delivered. The **ErrorStation** property is set to the station or stations that were printing when the error occurred. **Release 1.1 and later:** The **ErrorLevel** and **ErrorString** properties are also set.

The event handler may call synchronous print methods (but not asynchronous methods), then can either retry the outstanding output or clear it.

- ◆ The Control guarantees that asynchronous output is performed on a first-in first-out basis.
- ◆ All output buffered by OPOS may be deleted by calling the **ClearOutput** method. **OutputCompleteEvents** will not be fired for cleared output. This method also stops any output that may be in progress (when possible).
- ◆ The property **FlagWhenIdle** may be set to cause the Control to fire a **StatusUpdateEvent** when all outstanding outputs have finished, whether successfully or because they were cleared.

- **Release 1.1 and later -- Transaction Mode**

A transaction is a sequence of print operations that are printed to a station as a unit. Print operations which may be included in a transaction are **PrintNormal**, **CutPaper**, **RotatePrint**, **PrintBarCode**, **PrintBitmap** and **MarkFeed**. During a transaction, the print operations are first validated. If valid, they are added to the transaction but not printed yet. Once the application has added as many operations as required, then the transaction print method is called.

If the transaction is printed synchronously, then the returned status indicates either that the entire transaction printing successfully or that an error occurred during the print. If the transaction is printed asynchronously, then the asynchronous print rules listed above are followed. If an error occurs and the Error Event handler causes a retry, the entire transaction is retried.

The printer error reporting model is as follows:

Printer out-of-paper and cover open conditions are reported by setting the **ResultCode** to OPOS_E_EXTENDED and then setting **ResultCodeExtended** to one of the following error conditions:

OPOS_EPTR_JRN_EMPTY,
OPOS_EPTR_REC_EMPTY,
OPOS_EPTR_SLP_EMPTY,
OPOS_EPTR_COVER_OPEN,
OPOS_EPTR_JRN_CARTRIDGE_REMOVED,
OPOS_EPTR_REC_CARTRIDGE_REMOVED,
OPOS_EPTR_SLP_CARTRIDGE_REMOVED,
OPOS_EPTR_JRN_CARTRIDGE_EMPTY,
OPOS_EPTR_REC_CARTRIDGE_EMPTY,
OPOS_EPTR_SLP_CARTRIDGE_EMPTY,
OPOS_EPTR_JRN_HEAD_CLEANING,
OPOS_EPTR_REC_HEAD_CLEANING or
OPOS_EPTR_SLP_HEAD_CLEANING

- Other printer errors are reported by setting the **ResultCode** to OPOS_E_FAILURE or another standard error status. These failures are typically due to a printer fault or jam, or to a more serious error.

Release 1.5 and later – Print cartridge

The print cartridge model is as follows:

- CapJrnCartridgeSensor, CapRecCartridgeSensor and CapSlpCartridgeSensor properties are used to determine whether the printer has the ability to detect the operating condition of the cartridge.
- Prior to determining a cartridge's operating condition, a cartridge is selected by using one of the following properties: JrnCurrentCartridge, RecCurrentCartridge or SlpCurrentCartridge.
- The condition of the selected cartridge is set up using one of the JrnCartridgeState, RecCartridgeState or SlpCartridgeState properties. The values that these properties can take in order of high priority to low priority are as follows: PTR_CART_UNKNOWN, PTR_CART_REMOVED, PTR_CART_EMPTY, PTR_CART_CLEANING, PTR_CART_NEAREND, PRT_CART_OK.
- CapJrnColor, CapRecColor and CapSlpColor properties are used to determine the color capabilities of the station.
- Mono Color
 - ◆ CapJrnColor, CapRecColor and CapSlpColor properties equal PTR_COLOR_PRIMARY.
- 2 Color
 - ◆ CapJrnColor, CapRecColor and CapSlpColor properties are a logical OR combination of PTR_COLOR_PRIMARY and PTR_COLOR_CUSTOM1.
 - ◆ PTR_COLOR_CUSTOM1 refers to the secondary color, usually red.
 - ◆ Secondary color printing can be done by using the ESC|rC escape sequence.
- Custom Color
 - ◆ CapJrnColor, CapRecColor and CapSlpColor properties are a logical OR combination of PTR_COLOR_PRIMARY and any of the following bit values:
PTR_COLOR_CUSTOM1, PTR_COLOR_CUSTOM2,
PTR_COLOR_CUSTOM3, PTR_COLOR_CUSTOM4,
PTR_COLOR_CUSTOM5, PTR_COLOR_CUSTOM6
 - ◆ Selection of a custom color can be done using the ESC|#rC escape sequence.
- Full Color

- ◆ CapJrnColor, CapRecColor and CapSlpColor properties are a logical OR combination of PTR_COLOR_FULL and the following values, PTR_COLOR_CYAN, PTR_COLOR_MAGENTA, PTR_COLOR_YELLOW.
- ◆ PTR_COLOR_FULL is not used to indicate that a print cartridge is currently installed in the printer. Rather, it is used to indicate that the printer has the ability to print in a full color mode.
- ◆ Full color printing is accomplished by using the ESC|fC command.
- Full Color with Custom Color(s)
 - ◆ CapJrnColor, CapRecColor and CapSlpColor are a logical OR combination of the settings for Custom Color and Full Color.

Release 1.5 and later – Cartridge State Reporting Requirements for DeviceEnabled

The print cartridge state reporting model is:

- CartridgeNotify property:

The application may set this property to enable cartridge state reporting via **StatusUpdateEvent** events and **JrnCartridgeState**, **RecCartridgeState** and **SlpCartridgeState** properties. This property may only be set before the device is enabled (that is, before **DeviceEnabled** is set to TRUE). This restriction allows simpler implementation of cartridge status notification with no adverse effects on the application. The application is either prepared to receive notifications or does not want them, and has no need to switch between these cases. This property may be one of:

 - ◆ PTR_CN_DISABLED
 - ◆ PTR_CN_ENABLED

The following semantics are added to **DeviceEnabled** when **CapJrnCartridgeSensor**, **CapRecCartridgeSensor** and **CapSlpCartridgeSensor** are not 0, and **CartridgeNotify** is PTR_CN_ENABLED:

- Monitoring the cartridge state begins when the Control changes from DeviceEnabled FALSE to TRUE.
- When the Control changes from DeviceEnabled TRUE to FALSE, the state of the cartridge is no longer valid. Therefore: JrnCartridgeState, RecCartridgeState and SlpCartridgeState properties are set to PTR_CART_UNKNOWN.

Device Sharing

The POS Printer is an exclusive-use device, as follows:

- The application must claim the device before enabling it.
- The application must claim and enable the device before accessing many printer-specific properties.
- The application must claim and enable the device before calling methods that manipulate the device.
- See the “Summary” table for precise usage prerequisites.

Data Characters and Escape Sequences

The default character set of all POS printers is assumed to support at least the ASCII characters 20-hex through 7F-hex, which include spaces, digits, uppercase, lowercase, and some special characters. If the printer does not support lowercase characters, then the Service Object may translate them to uppercase.

Every escape sequence begins with the escape character ESC, whose value is 27 decimal, followed by a vertical bar ('|'). This is followed by zero or more digits and/or lowercase alphabetic characters. The escape sequence is terminated by an uppercase alphabetic character. Sequences that do not begin with ESC "|" are passed through to the printer. Also, sequences that begin with ESC "|" but which are not valid OPOS escape sequences are passed through to the printer.

To determine if escape sequences or data can be performed on a printer station, the application can call the **ValidateData** method. (For some escape sequences, corresponding capability properties can also be used.)

The following escape sequences are recognized. If an escape sequence specifies an operation that is not supported by the printer station, then it is ignored.

One Shots Perform indicated action.

<i>Name</i>	<i>Data</i>	<i>Remarks</i>
Paper cut	ESC #P	Cuts receipt paper. The character '#' is replaced by an ASCII decimal string telling the percentage cut desired. If '#' is omitted, then a full cut is performed. For example: The C string "\x1B 75P" requests a 75% partial cut.
Feed and Paper cut	ESC #fP	Cuts receipt paper, after feeding the paper by the RecLinesToPaperCut lines. The character '#' is defined by the "Paper cut" escape sequence.
Feed, Paper cut, and Stamp	ESC #sP	Cuts and stamps receipt paper, after feeding the paper by the RecLinesToPaperCut lines. The character '#' is defined by the "Paper cut" escape sequence.
Fire stamp	ESC sL	Fires the stamp solenoid, which usually contains a graphical store emblem.
Print bitmap	ESC #B	Prints the pre-stored bitmap. The character '#' is replaced by the bitmap number.
Print top logo	ESC tL	Prints the pre-stored top logo.
Print bottom logo	ESC bL	Prints the pre-stored bottom logo.
Feed lines	ESC #IF	Feed the paper forward by lines. The character '#' is replaced by an ASCII decimal string telling the number of lines to be fed. If '#' is omitted, then one line is fed.
Feed units	ESC #uF	Feed the paper forward by mapping mode units. The character '#' is replaced by an ASCII decimal string telling the number of units to be fed. If '#' is omitted, then one unit is fed.
Feed reverse	ESC #rF	Feed the paper backward. The character '#' is replaced by an ASCII decimal string telling the number of lines to be fed. If '#' is omitted, then one line is fed.

Print Mode Characteristics that are remembered until explicitly changed.

<i>Name</i>	Data	Remarks
Font typeface selection	ESC #fT	Selects a new typeface for the following data. Values for the character '#' are: 0 = Default typeface. 1 = Select first typeface from the FontTypefaceList property. 2 = Select second typeface from the FontTypefaceList property. And so on.

Print Line Characteristics that are reset at the end of each print method or by a “Normal” sequence.

<i>Name</i>	<i>Data</i>	<i>Remarks</i>
Bold	ESC bC	Prints in bold or double-strike.
Underline	ESC #uC	Prints with underline. The character ‘#’ is replaced by an ASCII decimal string telling the thickness of the underline in printer dot units. If ‘#’ is omitted, then a printer-specific default thickness is used.
Italic	ESC iC	Prints in italics.
Alternate color (Custom)	ESC #rC	Prints using an alternate custom color. The character ‘#’ is replaced by an ASCII decimal string indicating the desired color. The value of the decimal string is equal to the value of the cartridge constant used in the printer device properties. If ‘#’ is omitted, then the secondary color (Custom Color 1) is selected. Custom Color 1 is usually red.
Reverse video	ESC rvC	Prints in a reverse video format.
Shading	ESC #sC	Prints in a shaded manner. The character ‘#’ is replaced by an ASCII decimal string telling the percentage shading desired. If ‘#’ is omitted, then a printer-specific default level of shading is used.
Single high & wide	ESC 1C	Prints normal size.
Double wide	ESC 2C	Prints double-wide characters.
Double high	ESC 3C	Prints double-high characters.
Double high & wide	ESC 4C	Prints double-high/double-wide characters.
Scale horizontally	ESC #hC	Prints with the width scaled ‘#’ times the normal size, where ‘#’ is replaced by an ASCII decimal string.
Scale vertically	ESC #vC	Prints with the height scaled ‘#’ times the normal size, where ‘#’ is replaced by an ASCII decimal string.

RGB color	ESC #fC	Prints in # color. The character '#' is replaced by an ASCII decimal string indicating the additive amount of RGB to produce the desired color. There are 3 digits each of Red, Green and Blue elements. Valid values range from "000" to "255". (For example, "255255000" represents yellow.) Color Matching to the subtractive percentage of CMY (Cyan, Magenta and Yellow components) to produce the desired color matching specified by the RGB is up to the service object. If '#' is omitted, then the primary color is used. Bitmap printing is not affected.
Center	ESC cA	Aligns following text in the center.
Right justify	ESC rA	Aligns following text at the right.
Normal	ESC N	Restores printer characteristics to normal condition.
SubScript	ESC tbC	Prints SubScript characters.
SuperScript	ESC tpC	Prints SuperScript characters.

Properties

AsyncMode Property R/W

Syntax **BOOL AsyncMode;**

Remarks If TRUE, then the print methods **PrintNormal**, **PrintTwoNormal**, **CutPaper**, **RotatePrint**, **PrintBarCode**, and **PrintBitmap** will be performed asynchronously. If FALSE, they will be printed synchronously.

This property is initialized to FALSE by the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.

CapCharacterSet Property *Added in Release 1.1, Updated in Release 1.5*

Syntax **LONG CapCharacterSet;**

Remarks Holds the default character set capability. It may be one of the following:

Value	Meaning
PTR_CCS_ALPHA	The default character set supports uppercase alphabetic plus numeric, space, minus, and period.
PTR_CCS_ASCII	The default character set supports all ASCII characters between 20-hex and 7F-hex.
PTR_CCS_KANA	The default character set supports partial code page 932, including ASCII characters 20-hex through 7F-hex and the Japanese Kana characters A1-hex through DF-hex, but excluding the Japanese Kanji characters.
PTR_CCS_KANJI	The default character set supports code page 932, including the Shift-JIS Kanji characters, Levels 1 and 2.
PTR_CCS_UNICODE	The default character set supports UNICODE.

The default character set may contain a superset of these ranges. The initial **CharacterSet** property may be examined for additional information.

This property is initialized by the **Open** method.

CapConcurrentJrnRec Property

Syntax	BOOL CapConcurrentJrnRec;
Remarks	<p>If TRUE, then the Journal and Receipt stations can print at the same time. The PrintTwoNormal method may be used with the PTR_TWO_RECEIPT_JOURNAL and PTR_S_JOURNAL_RECEIPT station parameters.</p> <p>If FALSE, the application should print to only one of the stations at a time, and minimize transitions between the stations. Non-concurrent printing may be required for reasons such as:</p> <ul style="list-style-type: none">• Higher likelihood of error, such as greater chance of paper jams when moving between the stations.• Higher performance when each station is printed separately. <p>This property is initialized by the Open method.</p>

CapConcurrentJrnSlp Property

Syntax	BOOL CapConcurrentJrnSlp;
Remarks	<p>If TRUE, then the Journal and Slip stations can print at the same time. The PrintTwoNormal method may be used with the PTR_TWO_SLIP_JOURNAL and PTR_S_JOURNAL_SLIP station parameters.</p> <p>If FALSE, the application must use the sequence BeginInsertion/EndInsertion followed by print requests to the Slip followed by BeginRemoval/EndRemoval before printing on the Journal. Non-concurrent printing may be required for reasons such as:</p> <ul style="list-style-type: none">• Physical constraints, such as the Slip form being placed in front of the Journal station.• Higher likelihood of error, such as greater chance of paper jams when moving between the stations.• Higher performance when each station is printed separately. <p>This property is initialized by the Open method.</p>

CapConcurrentRecSlp Property

Syntax	BOOL CapConcurrentRecSlp;
Remarks	<p>If TRUE, then the Receipt and Slip stations can print at the same time. The PrintTwoNormal method may be used with the PTR_TWO_SLIP_RECEIPT and PTR_S_RECEIPT_SLIP station parameters.</p> <p>If FALSE, the application must use the sequence BeginInsertion/EndInsertion followed by print requests to the Slip followed by BeginRemoval/EndRemoval before printing on the Receipt. Non-concurrent printing may be required for reasons such as:</p> <ul style="list-style-type: none">• Physical constraints, such as the Slip form being placed in front of the Receipt station.• Higher likelihood of error, such as greater chance of paper jams when moving between the stations.• Higher performance when each station is printed separately. <p>This property is initialized by the Open method.</p>

CapCoverSensor Property

Syntax	BOOL CapCoverSensor;
Remarks	<p>If TRUE, then the printer has a “cover open” sensor; otherwise it is FALSE.</p> <p>This property is initialized by the Open method.</p>

CapJrn2Color Property

Syntax	BOOL CapJrn2Color;
Remarks	<p>If TRUE, then the journal can print dark plus an alternate color; otherwise it is FALSE.</p> <p>This property is initialized by the Open method.</p>

CapJrnBold Property

- Syntax** **BOOL CapJrnBold;**
- Remarks** If TRUE, then the journal can print bold characters;
otherwise it is FALSE.
- This property is initialized by the **Open** method.

CapJrnCartridgeSensor Property *Added in Release 1.5*

- Syntax** **LONG CapJrnCartridgeSensor;**
- Remarks** This bit mapped parameter is used to indicate the presence of Journal Cartridge monitoring sensors.

If **CapJrnPresent** is FALSE, this property is "0". Otherwise it is a logical OR combination of any of the following values.

Value	Meaning
PTR_CART_REMOVED	There is a function to indicate the Cartridge has been removed.
PTR_CART_EMPTY	There is a function to indicate the Cartridge is empty.
PTR_CART_NEAREND	There is a function to indicate the color Cartridge is near end.
PTR_CART_CLEANING	There is a function to indicate head is being cleaned.

This property is initialized by the **Open** method.

- See Also** **JrnCartridgeState** Property, **JrnCurrentCartridge** Property, **CartridgeNotify** Property

CapJrnColor Property***Added in Release 1.5*****Syntax** **LONG CapJrnColor;****Remarks** This parameter indicates available Journal color cartridges.

If **CapJrnPresent** is FALSE, this property is “0”. Otherwise, this property indicates the supported color cartridges.

CapJrnColor is a logical OR combination of any of the following values.

Value	Meaning
PTR_COLOR_PRIMARY	Supports Primary Color
PTR_COLOR_CUSTOM1	Supports 1 st Custom Color (Secondary Color, Usually Red)
PTR_COLOR_CUSTOM2	Supports 2 nd Custom Color
PTR_COLOR_CUSTOM3	Supports 3 rd Custom Color
PTR_COLOR_CUSTOM4	Supports 4 th Custom Color
PTR_COLOR_CUSTOM5	Supports 5 th Custom Color
PTR_COLOR_CUSTOM6	Supports 6 th Custom Color
PTR_COLOR_CYAN	Supports Cyan Color for full color printing
PTR_COLOR_MAGENTA	Supports Magenta Color for full color printing
PTR_COLOR_YELLOW	Supports Yellow Color for full color printing
PTR_COLOR_FULL	Supports Full Color.

This property is initialized by the **Open** method.

CapJrnDhigh Property**Syntax** **BOOL CapJrnDhigh;****Remarks** If TRUE, then the journal can print double high characters; otherwise it is FALSE.

This property is initialized by the **Open** method.

CapJrnDwide Property

Syntax	BOOL CapJrnDwide;
Remarks	If TRUE, then the journal can print double wide characters; otherwise it is FALSE. This property is initialized by the Open method.

CapJrnDwideDhigh Property

Syntax	BOOL CapJrnDwideDhigh;
Remarks	If TRUE, then the journal can print double high / double wide characters; otherwise it is FALSE. This property is initialized by the Open method.

CapJrnEmptySensor Property

Syntax	BOOL CapJrnEmptySensor;
Remarks	If TRUE, then the journal has an out-of-paper sensor; otherwise it is FALSE. This property is initialized by the Open method.

CapJrnItalic Property

Syntax	BOOL CapJrnItalic;
Remarks	If TRUE, then the journal can print italic characters; otherwise it is FALSE. This property is initialized by the Open method.

CapJrnNearEndSensor Property

Syntax	BOOL CapJrnNearEndSensor;
Remarks	If TRUE, then the journal has a low paper sensor; otherwise it is FALSE. This property is initialized by the Open method.

CapJrnPresent Property

Syntax	BOOL CapJrnPresent;
Remarks	If TRUE, then the journal print station is present; otherwise it is FALSE. This property is initialized by the Open method.

CapJrnUnderline Property

Syntax	BOOL CapJrnUnderline;
Remarks	If TRUE, then the journal can underline characters; otherwise it is FALSE. This property is initialized by the Open method.

CapRec2Color Property

Syntax	BOOL CapRec2Color;
Remarks	If TRUE, then the receipt can print dark plus an alternate color; otherwise it is FALSE. This property is initialized by the Open method.

CapRecBarCode Property

Syntax	BOOL CapRecBarCode;
Remarks	If TRUE, then the receipt has bar code printing capability; otherwise it is FALSE. This property is initialized by the Open method.

CapRecBitmap Property

Syntax	BOOL CapRecBitmap;
Remarks	If TRUE, then the receipt can print bitmaps; otherwise it is FALSE. This property is initialized by the Open method.

CapRecBold Property

Syntax	BOOL CapRecBold;
Remarks	If TRUE, then the receipt can print bold characters; otherwise it is FALSE. This property is initialized by the Open method.

CapRecCartridgeSensor Property *Added in Release 1.5*

Syntax **LONG CapRecCartridgeSensor;**

Remarks This bit mapped parameter is used to indicate the presence of Receipt Cartridge monitoring sensors.

If **CapRecPresent** is FALSE, this property is “0”. Otherwise it is a logical OR combination of any of the following values.

Value	Meaning
PTR_CART_REMOVED	There is a function to indicate the Cartridge has been removed.
PTR_CART_EMPTY	There is a function to indicate the Cartridge is empty.
PTR_CART_NEAREND	There is a function to indicate the color Cartridge is near end.
PTR_CART_CLEANING	There is a function to indicate head is being cleaned.

This property is initialized by the **Open** method.

See Also **RecCartridgeState** Property, **RecCurrentCartridge** Property, **CartridgeNotify** Property

CapRecColor Property***Added in Release 1.5*****Syntax** **LONG CapRecColor;****Remarks** This parameter indicates the Receipt color cartridges.

If **CapRecPresent** is FALSE, this property is “0”. Otherwise, this property indicates the supported color cartridges.

CapRecColor is a logical OR combination of any of the following values.

Value	Meaning
PTR_COLOR_PRIMARY	Supports Primary Color (Usually Black)
PTR_COLOR_CUSTOM1	Supports 1 st Custom Color (Secondary Color, Usually Red)
PTR_COLOR_CUSTOM2	Supports 2 nd Custom Color
PTR_COLOR_CUSTOM3	Supports 3 rd Custom Color
PTR_COLOR_CUSTOM4	Supports 4 th Custom Color
PTR_COLOR_CUSTOM5	Supports 5 th Custom Color
PTR_COLOR_CUSTOM6	Supports 6 th Custom Color
PTR_COLOR_CYAN	Supports Cyan Color for full color printing
PTR_COLOR_MAGENTA	Supports Magenta Color for full color printing
PTR_COLOR_YELLOW	Supports Yellow Color for full color printing
PTR_COLOR_FULL	Supports Full Color.

This property is initialized by the **Open** method.

CapRecDhigh Property**Syntax** **BOOL CapRecDhigh;****Remarks** If TRUE, then the receipt can print double high characters; otherwise it is FALSE.

This property is initialized by the **Open** method.

CapRecDwide Property

Syntax	BOOL CapRecDwide;
Remarks	If TRUE, then the receipt can print double wide characters; otherwise it is FALSE. This property is initialized by the Open method.

CapRecDwideDhigh Property

Syntax	BOOL CapRecDwideDhigh;
Remarks	If TRUE, then the receipt can print double high / double wide characters; otherwise it is FALSE. This property is initialized by the Open method.

CapRecEmptySensor Property

Syntax	BOOL CapRecEmptySensor;
Remarks	If TRUE, then the receipt has an out-of-paper sensor; otherwise it is FALSE. This property is initialized by the Open method.

CapRecItalic Property

Syntax	BOOL CapRecItalic;
Remarks	If TRUE, then the receipt can print italic characters; otherwise it is FALSE. This property is initialized by the Open method.

CapRecLeft90 Property

Syntax **BOOL CapRecLeft90;**

Remarks If TRUE, then the receipt can print in rotated 90° left mode; otherwise it is FALSE.

This property is initialized by the **Open** method.

CapRecMarkFeed Property *Added in Release 1.5*

Syntax **LONG CapRecMarkFeed;**

Remarks: This parameter indicates the type of mark sensed paper handling available.

CapRecMarkFeed is a logical OR combination of the following values. The values are identical to those used with the **MarkFeed** method.

Value	Meaning
PTR_MF_TO_TAKEUP	Feed the Mark Sensed paper to the paper take-up position.
PTR_MF_TO_CUTTER	Feed the Mark Sensed paper to the auto cutter cutting position.
PTR_MF_TO_CURRENT_TOF	Feed the Mark Sensed paper to the present paper's top of form. (Reverse feed if required)
PTR_MF_TO_NEXT_TOF	Feed the Mark Sensed paper to the next paper's top of form.

If **CapRecMarkFeed** equals "0", mark sensed paper handling is not supported.

This property is initialized by the **Open** method.

See Also **MarkFeed** Method

CapRecNearEndSensor Property

Syntax	BOOL CapRecNearEndSensor;
Remarks	If TRUE, then the receipt has a low paper sensor; otherwise it is FALSE. This property is initialized by the Open method.

CapRecPapercut Property

Syntax	BOOL CapRecPapercut;
Remarks	If TRUE, then the receipt can perform paper cuts; otherwise it is FALSE. This property is initialized by the Open method.

CapRecPresent Property

Syntax	BOOL CapRecPresent;
Remarks	If TRUE, then the receipt print station is present; otherwise it is FALSE. This property is initialized by the Open method.

CapRecRight90 Property

Syntax	BOOL CapRecRight90;
Remarks	If TRUE, then the receipt can print in a rotated 90° right mode; otherwise it is FALSE. This property is initialized by the Open method.

CapRecRotate180 Property

Syntax	BOOL CapRecRotate180;
Remarks	If TRUE, then the receipt can print in a rotated upside down mode; otherwise it is FALSE. This property is initialized by the Open method.

CapRecStamp Property

Syntax	BOOL CapRecStamp;
Remarks	If TRUE, then the receipt has a stamp capability; otherwise it is FALSE. This property is initialized by the Open method.

CapRecUnderline Property

Syntax	BOOL CapRecUnderline;
Remarks	If TRUE, then the receipt can underline characters; otherwise it is FALSE. This property is initialized by the Open method.

CapSlp2Color Property

Syntax	BOOL CapSlp2Color;
Remarks	If TRUE, then the slip can print dark plus an alternate color; otherwise it is FALSE. This property is initialized by the Open method.

CapSlpBarCode Property

Syntax	BOOL CapSlpBarCode;
Remarks	If TRUE, then the slip has bar code printing capability; otherwise it is FALSE. This property is initialized by the Open method.

CapSlpBitmap Property

Syntax	BOOL CapSlpBitmap;
Remarks	If TRUE, then the slip can print bitmaps; otherwise it is FALSE. This property is initialized by the Open method.

CapSlpBold Property

Syntax	BOOL CapSlpBold;
Remarks	If TRUE, then the slip can print bold characters; otherwise it is FALSE. This property is initialized by the Open method.

CapSlpBothSidesPrint Property *Added in Release 1.5*

Syntax	BOOL CapSlpBothSidesPrint;
Remarks	If TRUE, then the slip print station can support printing on both sides of the document; otherwise it is FALSE. This property is initialized by the Open method.

CapSlpCartridgeSensor Property *Added in Release 1.5*

Syntax **LONG CapSlpCartridgeSensor;**

Remarks This bit mapped parameter is used to indicate the presence of Slip Cartridge monitoring sensors.

If **CapSlpPresent** is FALSE, this property is "0". Otherwise it is a logical OR combination of any of the following values.

Value	Meaning
PTR_CART_REMOVED	There is a function to indicate the Cartridge has been removed.
PTR_CART_EMPTY	There is a function to indicate the Cartridge is empty.
PTR_CART_NEAREND	There is a function to indicate the color Cartridge is near end.
PTR_CART_CLEANING	There is a function to indicate head is being cleaned.

This property is initialized by the **Open** method.

See Also **SlpCartridgeState** Property, **SlpCurrentCartridge** Property, **CartridgeNotify** Property

CapSlpColor Property***Added in Release 1.5*****Syntax** **LONG CapSlpColor;****Remarks** This parameter indicates the Slip printing color cartridges.

If **CapSlpPresent** is FALSE, this property is “0”. Otherwise, this property indicates the supported color cartridges.

CapSlpColor is a logical OR combination of any of the following values.

Value	Meaning
PTR_COLOR_PRIMARY	Supports Primary Color (Usually Black)
PTR_COLOR_CUSTOM1	Supports 1 st Custom Color (Secondary Color, Usually Red)
PTR_COLOR_CUSTOM2	Supports 2 nd Custom Color
PTR_COLOR_CUSTOM3	Supports 3 rd Custom Color
PTR_COLOR_CUSTOM4	Supports 4 th Custom Color
PTR_COLOR_CUSTOM5	Supports 5 th Custom Color
PTR_COLOR_CUSTOM6	Supports 6 th Custom Color
PTR_COLOR_CYAN	Supports Cyan Color for full color printing
PTR_COLOR_MAGENTA	Supports Magenta Color for full color printing
PTR_COLOR_YELLOW	Supports Yellow Color for full color printing
PTR_COLOR_FULL	Supports Full Color.

This property is initialized by the **Open** method.

CapSlpDhigh Property**Syntax** **BOOL CapSlpDhigh;****Remarks** If TRUE, then the slip can print double high characters; otherwise it is FALSE.

This property is initialized by the **Open** method.

CapSlpDwide Property

Syntax	BOOL CapSlpDwide;
Remarks	If TRUE, then the slip can print double wide characters; otherwise it is FALSE. This property is initialized by the Open method.

CapSlpDwideDhigh Property

Syntax	BOOL CapSlpDwideDhigh;
Remarks	If TRUE, then the slip can print double high / double wide characters; otherwise it is FALSE. This property is initialized by the Open method.

CapSlpEmptySensor Property

Syntax	BOOL CapSlpEmptySensor;
Remarks	If TRUE, then the slip has a “slip in” sensor; otherwise it is FALSE. This property is initialized by the Open method.

CapSlpFullslip Property

Syntax	BOOL CapSlpFullslip;
Remarks	If TRUE, then the slip is a full slip station. It can print full-length forms.. If FALSE, then the slip is a “validation” type station. This usually limits the number of print lines, and disables access to the receipt and/or journal stations while the validation slip is being used. This property is initialized by the Open method.

CapSlpItalic Property

Syntax	BOOL CapSlpItalic;
Remarks	If TRUE, then the slip can print italic characters; otherwise it is FALSE. This property is initialized by the Open method.

CapSlpLeft90 Property

Syntax	BOOL CapSlpLeft90;
Remarks	If TRUE, then the slip can print in a rotated 90° left mode; otherwise it is FALSE. This property is initialized by the Open method.

CapSlpNearEndSensor Property

Syntax	BOOL CapSlpNearEndSensor;
Remarks	If TRUE, then the slip has a “slip near end” sensor; otherwise it is FALSE. This property is initialized by the Open method.

CapSlpPresent Property

Syntax	BOOL CapSlpPresent;
Remarks	If TRUE, then the slip print station is present; otherwise it is FALSE. This property is initialized by the Open method.

CapSlpRight90 Property

Syntax **BOOL CapSlpRight90;**

Remarks If TRUE, then the slip can print in a rotated 90° right mode;
otherwise it is FALSE.

This property is initialized by the **Open** method.

CapSlpRotate180 Property

Syntax **BOOL CapSlpRotate180;**

Remarks If TRUE, then the slip can print in a rotated upside down mode;
otherwise it is FALSE.

This property is initialized by the **Open** method.

CapSlpUnderline Property

Syntax **BOOL CapSlpUnderline;**

Remarks If TRUE, then the slip can underline characters;
otherwise it is FALSE.

This property is initialized by the **Open** method.

CapTransaction Property***Added in Release 1.1*****Syntax** **BOOL CapTransaction;****Remarks** If TRUE, then printer transactions are supported by each station;
otherwise it is FALSE.

This property is initialized by the **Open** method.

CartridgeNotify Property R/W***Added in Release 1.5*****Syntax** **LONG CartridgeNotify;****Remarks** Contains the type of cartridge state notification as selected by the Application.

The **CartridgeNotify** values are:

Value	Meaning
PTR_CN_DISABLED	The Control will not provide any cartridge state notifications to the application. No cartridge state notification StatusUpdateEvents will be fired, and JrnCartridgeState , RecCartridgeState and SlpCartridgeState may not be set.
PTR_CN_ENABLED	The Control will fire cartridge state notification StatusUpdateEvents and update JrnCartridgeState , RecCartridgeState and SlpCartridgeState , beginning when DeviceEnabled is set to TRUE. The level of functionality depends upon CapJrnCartridgeSensor , CapRecCartridgeSensor and CapSlpCartridgeSensor .

CartridgeNotify may only be set while the device is disabled, that is, while **DeviceEnabled** is FALSE.

This property is initialized to PTR_CN_DISABLED by the **Open** method. This value provides compatibility with earlier releases.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	One of the following occurred: <ul style="list-style-type: none">• The device is already enabled.

- **CartridgeNotify** = OPOS_CN_ENABLED but **CapJrnCartridgeSensor**, **CapRecCartridgeSensor** and **CapSlpCartridgeSensor** = "0".

Other Values

See **ResultCode**.

See Also **CapJrnCartridgeSensor** Property, **CapRecCartridgeSensor** Property, **CapSlpCartridgeSensor** Property, **JrnCartridgeState** Property, **RecCartridgeState** Property, **SlpCartridgeState** Property

CharacterSet Property R/W Updated in Release 1.5**Syntax** **LONG CharacterSet;****Remarks** The character set for printing characters.

This property is initialized when the device is first enabled following the **Open** method.

Values are:

Value	Meaning
Range 101 - 199	Device-specific character sets that do not match a code page or the ASCII or Windows ANSI character sets.
Range 400 - 990	Code page; matches one of the standard values.
PTR_CS_UNICODE	The character set supports UNICODE. The value of this constant is 997.
PTR_CS_ASCII	The ASCII character set, supporting the ASCII characters between 0x20 and 0x7F. The value of this constant is 998.
PTR_CS_WINDOWS	The Windows ANSI character set. The value of this constant is 999. This is exactly equivalent to the Windows code page 1252.
Range 1000 and higher	Windows code page; matches one of the standard values.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An invalid property value was used.
<i>Other Values</i>	See ResultCode .

See Also **CharacterSetList** Property

CharacterSetList Property

Syntax **BSTR CharacterSetList;**

Remarks A string of character set numbers.

This property is initialized by the **Open** method. The string consists of ASCII numeric set numbers separated by commas.

For example, if the string is “101,850,999”, then the device supports a device-specific character set, code page 850, and the Windows ANSI character set.

See Also **CharacterSet** Property

CoverOpen Property

Syntax **BOOL CoverOpen;**

Remarks If TRUE, then the printer’s cover is open;
otherwise it is FALSE.

If the **CapCoverSensor** property is FALSE, then the printer does not have a cover open sensor, and this property always returns FALSE.

This property is initialized and kept current while the device is enabled.

ErrorLevel Property***Added in Release 1.1*****Syntax** **LONG ErrorLevel;****Remarks** The severity of the error condition.

Values are:

Value	Meaning
PTR_EL_NONE	No error condition is present.
PTR_EL_RECOVERABLE	A recoverable error has occurred. (Example: Out of paper.)
PTR_EL_FATAL	A non-recoverable error has occurred. (Example: Internal printer failure.)

This property is set by the Control just before delivering an **ErrorEvent**. When the error is cleared, then the property is changed to PTR_EL_NONE.

ErrorStation Property**Syntax** **LONG ErrorStation;****Remarks** Holds the station or stations that were printing when an error was detected.

This property will be set to one of the following values:

PTR_S_JOURNAL, PTR_S_RECEIPT, PTR_S_SLIP,
PTR_S_JOURNAL_RECEIPT, PTR_S_JOURNAL_SLIP,
PTR_S_RECEIPT_SLIP,
PTR_TWO_RECEIPT_JOURNAL, PTR_TWO_SLIP_JOURNAL,
PTR_TWO_SLIP_RECEIPT.

This property is set just before an **ErrorEvent** is delivered.

ErrorString Property***Added in Release 1.1*****Syntax** **BSTR ErrorString;****Remarks** A vendor-supplied description of the current error.

This property is set by the Control just before delivering an **ErrorEvent**. If no description is available, the property is set to an empty string. When the error is cleared, then the property is changed to an empty string.

FlagWhenIdle Property R/W**Syntax** **BOOL FlagWhenIdle;**

Remarks If TRUE, the Control will fire a **StatusUpdateEvent** if it is in the idle state. If FALSE, this event will not be fired.

FlagWhenIdle is automatically reset to FALSE when the status event is fired.

The main use of idle status event that is controlled by this property is to give the application control when all outstanding asynchronous outputs have been processed. The event will be fired if the outputs were completed successfully or if they were cleared by the **ClearOutput** method or by an **ErrorEvent** handler.

If the **State** is already set to OPOS_S_IDLE when the **FlagWhenIdle** property is set to TRUE, then a **StatusUpdateEvent** is fired immediately. The application can therefore depend upon the event, with no race condition between the starting of its last asynchronous output and the setting of this flag.

This property is initialized to FALSE by the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.

FontTypefaceList Property***Added in Release 1.1*****Syntax** **BSTR FontTypefaceList;****Remarks** A string that specifies the fonts and/or typefaces that are supported by the printer.

This property is initialized by the **Open** method. The string consists of font or typeface names separated by commas. The application selects a font or typeface for a printer station by using the font typeface selection escape sequence (ESC|#fT). The “#” character is replaced by the number of the font or typeface within the list: 1, 2, and so on.

In Japan, this property will frequently include the fonts “Mincho” and “Gothic”. Other fonts or typefaces may be commonly supported in other countries.

An empty string indicates that only the default typeface is supported.

See Also “Data Characters and Escape Sequences”

JrnCartridgeState Property *Added in Release 1.5*

Syntax **LONG JrnCartridgeState;**

Remarks This parameter indicates the status of the currently selected Journal cartridge (ink, ribbon or toner).

Values are:

Value	Meaning
PTR_CART_UNKNOWN	Cannot determine the cartridge state, for one of the following reasons: <ul style="list-style-type: none"> • CapJrnCartridgeSensor = "0". Device does not support cartridge state reporting. • CartridgeNotify = PTR_CN_DISABLED. Cartridge state notifications are disabled. • DeviceEnabled = FALSE. Cartridge state monitoring does not occur until the device is enabled.
PTR_CART_REMOVED	The cartridge selected by JrnCurrentCartridge has been removed.
PTR_CART_EMPTY	The cartridge selected by JrnCurrentCartridge is empty.
PTR_CART_CLEANING	The head selected by JrnCurrentCartridge is being cleaned
PTR_CART_NEAREND	The cartridge selected by JrnCurrentCartridge is near end.
PTR_CART_OK	The cartridge selected by JrnCurrentCartridge is normal condition.

Note that the above mentioned values are arranged according to their priority level.

This property is initialized and kept current while the device is enabled.

See Also **JrnCurrentCartridge** Property, **CapJrnCartridgeSensor** Property, **CartridgeNotify** Property

JrnCurrentCartridge Property R/W Added in Release 1.5

Syntax	LONG JrnCurrentCartridge;								
Remarks	<p>This property specifies the currently selected Journal cartridge.</p> <p>This property is initialized when the device is first enabled following the Open method.</p> <p>This value is guaranteed to be one of the color cartridges specified by the CapJrnColor property. (PTR_COLOR_FULL can not be set.)</p> <p>Setting JrnCurrentCartridge may also update JrnCartridgeState.</p>								
Return	<p>When this property is set, one of the following values is placed in the ResultCode property:</p> <table><tr><th>Value</th><th>Meaning</th></tr><tr><td>OPOS_SUCCESS</td><td>The property was set successfully.</td></tr><tr><td>OPOS_E_ILLEGAL</td><td>An invalid property value was used.</td></tr><tr><td><i>Other Values</i></td><td>See ResultCode.</td></tr></table>	Value	Meaning	OPOS_SUCCESS	The property was set successfully.	OPOS_E_ILLEGAL	An invalid property value was used.	<i>Other Values</i>	See ResultCode .
Value	Meaning								
OPOS_SUCCESS	The property was set successfully.								
OPOS_E_ILLEGAL	An invalid property value was used.								
<i>Other Values</i>	See ResultCode .								
See Also	JrnCartridgeState Property								

JrnEmpty Property

Syntax	BOOL JrnEmpty;
Remarks	<p>If TRUE, the journal is out of paper. If FALSE, journal paper is present.</p> <p>If the capability CapJrnEmptySensor is FALSE, then the value of this property is always FALSE.</p> <p>This property is initialized and kept current while the device is enabled.</p>
See Also	JrnNearEnd Property

JrnLetterQuality Property R/W

Syntax **BOOL JrnLetterQuality;**

Remarks If TRUE, prints in high quality mode.
If FALSE, prints in high speed mode.

This property advises the Service Object that either high quality or high speed printing is desired. For example, printers with bi-directional print capability may be placed in unidirectional mode for high quality, so that column alignment is more precise.

Setting **JrnLetterQuality** may also update **JrnLineWidth**, **JrnLineHeight**, and **JrnLineSpacing** if **MapMode** is PTR_MM_DOTS. (See the footnote at **MapMode**.)

This property is initialized to FALSE when the device is first enabled following the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.

JrnLineChars Property R/W

Syntax **LONG JrnLineChars;**

Remarks The number of characters that may be printed on a journal line.

If changed to a line character width that can be supported, then the width is set to the specified value. If the exact width cannot be supported and the value is less than the maximum value allowed for the printer, then subsequent lines will be printed with a character size that most closely supports the specified characters per line. (For example, if set to 36 and the printer can print either 30 or 40 characters per line, then the Service Object should select the character size “40” and print up to 36 characters on each line.)

If the character width cannot be supported and the value is greater than the maximum value allowed for the printer, then an error is returned. (For example, if set to 42 and the printer can print either 30 or 40 characters per line, then the Service Object cannot support the request.)

Setting **JrnLineChars** may also update **JrnLineWidth**, **JrnLineHeight**, and **JrnLineSpacing**, since the character pitch or font may be changed.

The value of **JrnLineChars** is initialized to the printer’s default line character width when the device is first enabled following the **Open** method.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An invalid line character width was specified.

See Also **JrnLineCharsList** Property

JrnLineCharsList Property

Syntax **BSTR JrnLineCharsList;**

Remarks A string containing the line character widths supported by the journal station.

This property is initialized by the **Open** method. The string consists of ASCII numeric set numbers separated by commas.

For example, if the string is “32,36,40”, then the station supports line widths of 32, 36, and 40 characters.

See Also **JrnLineChars** Property

JrnLineHeight Property R/W

Syntax **LONG JrnLineHeight;**

Remarks The journal print line height. Expressed in the unit of measure given by **MapMode**.

If changed to a height that can be supported with the current character width, then the line height is set to this value. If the exact height cannot be supported, then the height is set to the closest supported value.

When **JrnLineChars** is changed, **JrnLineHeight** is updated to the default line height for the selected width.

The value of **JrnLineHeight** is initialized to the printer’s default line height when the device is first enabled following the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.

JrnLineSpacing Property R/W

Syntax	LONG JrnLineSpacing;				
Remarks	<p>The spacing of each single-high print line, including both the printed line height plus the whitespace between each pair of lines. Depending upon the printer and the current line spacing, a multi-high print line might exceed this value. Line spacing is expressed in the unit of measure given by MapMode.</p> <p>If changed to a spacing that can be supported by the printer, then the line spacing is set to this value. If the spacing cannot be supported, then the spacing is set to the closest supported value.</p> <p>When JrnLineChars or JrnLineHeight is changed, JrnLineSpacing is updated to the default line spacing for the selected width or height.</p> <p>The value of JrnLineSpacing is initialized to the printer's default line spacing when the device is first enabled following the Open method.</p>				
Return	<p>When this property is set, the following value is placed in the ResultCode property:</p> <table><tr><th>Value</th><th>Meaning</th></tr><tr><td>OPOS_SUCCESS</td><td>The property was set successfully.</td></tr></table>	Value	Meaning	OPOS_SUCCESS	The property was set successfully.
Value	Meaning				
OPOS_SUCCESS	The property was set successfully.				

JrnLineWidth Property

Syntax	LONG JrnLineWidth;
Remarks	<p>The width of a line of JrnLineChars characters. Expressed in the unit of measure given by MapMode.</p> <p>Setting JrnLineChars may also update JrnLineWidth.</p> <p>The value of JrnLineWidth is initialized to the printer's default line width when the device is first enabled following the Open method.</p>

JrnNearEnd Property

Syntax **BOOL JrnNearEnd;**

Remarks If TRUE, the journal paper is low.
 If FALSE, journal paper is not low.

If the capability **CapJrnNearEndSensor** is FALSE, then the value of this property is always FALSE.

This property is initialized and kept current while the device is enabled.

See Also **JrnEmpty** Property

MapMode Property R/W**Syntax** **LONG MapMode;****Remarks** Contains the mapping mode of the printer. The mapping mode defines the unit of measure used for other properties, such as line heights and line spacings.

The following map modes are supported:

Value	Meaning
PTR_MM_DOTS	The printer's dot width. This width may be different for each printer station. ⁹
PTR_MM_TWIPS	1/1440 of an inch.
PTR_MM_ENGLISH	0.001 inch.
PTR_MM_METRIC	0.01 millimeter.

Setting **MapMode** may also change **JrnLineHeight**, **JrnLineSpacing**, **JrnLineWidth**, **RecLineHeight**, **RecLineSpacing**, **RecLineWidth**, **SlpLineHeight**, **SlpLineSpacing**, and **SlpLineWidth**.

The value of **MapMode** is initialized to PTR_MM_DOTS when the device is first enabled following the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An invalid mapping mode was specified.

⁹ From the OPOS POS Printer perspective, the exact definition of a "dot" is not significant. It is a Printer/Service Object unit used to express various metrics. For example, some printers define a "half-dot" that is used in high-density graphics printing, and perhaps in text printing. An OPOS POS Printer Service Object may handle this case in one of these ways:

- Consistently define a "dot" as the printer's smallest physical size, that is, a half-dot.
- If the Service Object changes bitmap graphics printing density based on the **XxxLetterQuality** setting, then alter the size of a dot to match the bitmap density (that is, a physical printer dot when FALSE and a half-dot when TRUE). Note that this choice should not be used if the printer's text metrics are based on half-dot sizes, since accurate values for the metrics may not then be possible.

RecBarCodeRotationList Property *Added in Release 1.1*

Syntax **BSTR RecBarCodeRotationList;**

Remarks A string that specifies the directions in which a receipt barcode may be rotated.

This property is initialized by the **Open** method. The string consists of rotation strings separated by commas. An empty string indicates that bar code printing is not supported. The legal rotation strings are:

Value	Meaning
0	Bar code may be printed in the normal orientation.
R90	Bar code may be rotated 90° to the right.
L90	Bar code may be rotated 90° to the left.
180	Bar code may be rotated 180° - upside down.

For example, if the string is "0,180", then the printer can print normal bar codes and upside down bar codes.

See Also **RotateSpecial** Property; **PrintBarCode** Method

RecCartridgeState Property *Added in Release 1.5***Syntax** LONG RecCartridgeState;**Remarks** This parameter indicates the status of the currently selected Receipt cartridge (ink, ribbon or toner).

Values are:

Value	Meaning
PTR_CART_UNKNOWN	Cannot determine the cartridge state, for one of the following reasons: <ul style="list-style-type: none"> CapRecCartridgeSensor = "0". Device does not support cartridge state reporting. CartridgeNotify = PTR_CN_DISABLED. Cartridge state notifications are disabled. DeviceEnabled = FALSE. Cartridge state monitoring does not occur until the device is enabled.
PTR_CART_REMOVED	The cartridge selected by RecCurrentCartridge has been removed.
PTR_CART_EMPTY	The cartridge selected by RecCurrentCartridge is empty.
PTR_CART_CLEANING	The head selected by RecCurrentCartridge is being cleaned
PTR_CART_NEAREND	The cartridge selected by RecCurrentCartridge is near end.
PTR_CART_OK	The cartridge selected by RecCurrentCartridge is normal condition.

Note that the above mentioned values are arranged according to their priority level.

This property is initialized and kept current while the device is enabled.

See Also **RecCurrentCartridge** Property, **CapRecCartridgeSensor** Property, **CartridgeNotify** Property

RecCurrentCartridge Property R/W Added in Release 1.5

Syntax	LONG RecCurrentCartridge;								
Remarks	<p>This property indicates the currently selected Receipt cartridge.</p> <p>This property is initialized when the device is first enabled following the Open method.</p> <p>This value is guaranteed to be one of the color cartridges specified by the CapRecColor property. (PTR_COLOR_FULL can not be set.)</p> <p>Setting RecCurrentCartridge may also update RecCartridgeState.</p>								
Return	<p>When this property is set, one of the following values is placed in the ResultCode property:</p> <table><tr><th>Value</th><th>Meaning</th></tr><tr><td>OPOS_SUCCESS</td><td>The property was set successfully.</td></tr><tr><td>OPOS_E_ILLEGAL</td><td>An invalid property value was used.</td></tr><tr><td><i>Other Values</i></td><td>See ResultCode.</td></tr></table>	Value	Meaning	OPOS_SUCCESS	The property was set successfully.	OPOS_E_ILLEGAL	An invalid property value was used.	<i>Other Values</i>	See ResultCode .
Value	Meaning								
OPOS_SUCCESS	The property was set successfully.								
OPOS_E_ILLEGAL	An invalid property value was used.								
<i>Other Values</i>	See ResultCode .								
See Also	RecCartridgeState Property								

RecEmpty Property

Syntax	BOOL RecEmpty;
Remarks	<p>If TRUE, the receipt is out of paper. If FALSE, receipt paper is present.</p> <p>If the capability CapRecEmptySensor is FALSE, then the value of this property is always FALSE.</p> <p>This property is initialized and kept current while the device is enabled.</p>
See Also	RecNearEnd Property

RecLetterQuality Property R/W

Syntax **BOOL RecLetterQuality;**

Remarks If TRUE, prints in high quality mode.
If FALSE, prints in high speed mode.

This property advises the Service Object that either high quality or high speed printing is desired.

For example:

- Printers with bi-directional print capability may be placed in unidirectional mode for high quality, so that column alignment is more precise.
- Bitmaps may be printed in a high-density graphics mode for high-quality, and in a low-density mode for high speed.

Setting **RecLetterQuality** may also update **RecLineWidth**, **RecLineHeight**, and **RecLineSpacing** if **MapMode** is PTR_MM_DOTS. (See the footnote at **MapMode**.)

This property is initialized to FALSE when the device is first enabled following the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
--------------	----------------

OPOS_SUCCESS	The property was set successfully.
--------------	------------------------------------

RecLineChars Property R/W

Syntax **LONG RecLineChars;**

Remarks The number of characters that may be printed on a receipt line.

If changed to a line character width that can be supported, then the width is set to the specified value. If the exact width cannot be supported and the value is less than the maximum value allowed for the printer, then subsequent lines will be printed with a character size that most closely supports the specified characters per line. (For example, if set to 36 and the printer can print either 30 or 40 characters per line, then the Service Object should select the character size “40” and print up to 36 characters on each line.)

If the character width cannot be supported and the value is greater than the maximum value allowed for the printer, then an error is returned. (For example, if set to 42 and the printer can print either 30 or 40 characters per line, then the Service Object cannot support the request.)

Setting **RecLineChars** may also update **RecLineWidth**, **RecLineHeight**, and **RecLineSpacing**, since the character pitch or font may be changed.

The value of **RecLineChars** is initialized to the printer’s default line character width when the device is first enabled following the **Open** method.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An invalid line character width was specified.

See Also **RecLineCharsList** Property

RecLineCharsList Property

Syntax **BSTR RecLineCharsList;**

Remarks A string containing the line character widths supported by the receipt station.

This property is initialized by the **Open** method. The string consists of ASCII numeric set numbers, separated by commas.

For example, if the string is “32,36,40”, then the station supports line widths of 32, 36, and 40 characters.

See Also **RecLineChars** Property

RecLineHeight Property R/W

Syntax **LONG RecLineHeight;**

Remarks The receipt print line height. Expressed in the unit of measure given by **MapMode**.

If changed to a height that can be supported with the current character width, then the line height is set to this value. If the exact height cannot be supported, then the height is set to the closest supported value.

When **RecLineChars** is changed, **RecLineHeight** is updated to the default line height for the selected width.

The value of **RecLineHeight** is initialized to the printer’s default line height when the device is first enabled following the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.

See Also **RecLineChars** Property

RecLineSpacing Property R/W

Syntax **LONG RecLineSpacing;**

Remarks The spacing of each single-high print line, including both the printed line height plus the whitespace between each pair of lines. Depending upon the printer and the current line spacing, a multi-high print line might exceed this value. Line spacing is expressed in the unit of measure given by **MapMode**.

If changed to a spacing that can be supported by the printer, then the line spacing is set to this value. If the spacing cannot be supported, then the spacing is set to the closest supported value.

When **RecLineChars** or **RecLineHeight** are changed, **RecLineSpacing** is updated to the default line spacing for the selected width or height.

The value of **RecLineSpacing** is initialized to the printer's default line spacing when the device is first enabled following the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.

RecLinesToPaperCut Property

Syntax **LONG RecLinesToPaperCut;**

Remarks Holds the number of lines that must be advanced before the receipt paper is cut.

If the capability **CapRecPapercut** is TRUE, then this is the line count before reaching the paper cut mechanism. Otherwise, this is the line count before the manual tear-off bar.

Changing the properties **RecLineChars**, **RecLineHeight**, and **RecLineSpacing** may cause this property to change.

This property is initialized when the device is first enabled following the **Open** method.

RecLineWidth Property

Syntax	LONG RecLineWidth;
Remarks	<p>The width of a line of RecLineChars characters. Expressed in the unit of measure given by MapMode.</p> <p>Setting RecLineChars may also update RecLineWidth.</p> <p>The value of RecLineWidth is initialized to the printer's default line width when the device is first enabled following the Open method.</p>

RecNearEnd Property

Syntax	BOOL RecNearEnd;
Remarks	<p>If TRUE, the receipt paper is low. If FALSE, receipt paper is not low.</p> <p>If the capability CapRecNearEndSensor is FALSE, then the value of this property is always FALSE.</p> <p>This property is initialized and kept current while the device is enabled.</p>
See Also	RecEmpty Property

RecSidewaysMaxChars Property

Syntax	LONG RecSidewaysMaxChars;
Remarks	<p>Holds the maximum number of characters that may be printed on each line in sideways mode.</p> <p>If the capabilities CapRecLeft90 and CapRecRight90 are both FALSE, then RecSidewaysMaxChars is zero.</p> <p>Changing the properties RecLineHeight, RecLineSpacing, and RecLineChars may cause this property to change.</p> <p>This property is initialized when the device is first enabled following the Open method.</p>
See Also	RecSidewaysMaxLines Property

RecSidewaysMaxLines Property

Syntax	LONG RecSidewaysMaxLines;
Remarks	<p>Holds the maximum number of lines that may be printed in sideways mode.</p> <p>If the capabilities CapRecLeft90 and CapRecRight90 are both FALSE, then RecSidewaysMaxLines is zero.</p> <p>Changing the properties RecLineHeight, RecLineSpacing, and RecLineChars may cause this property to change.</p> <p>This property is initialized when the device is first enabled following the Open method.</p>
See Also	RecSidewaysMaxChars Property

RotateSpecial Property R/W *Added in Release 1.1***Syntax** LONG RotateSpecial;**Remarks** The rotation orientation for bar codes.This property is initialized to PTR_RP_NORMAL by the **Open** method.

Values are:

Value	Meaning
PTR_RP_NORMAL	Print subsequent bar codes in normal orientation.
PTR_RP_RIGHT90	Rotate printing 90° to the right (clockwise).
PTR_RP_LEFT90	Rotate printing 90° to the left (counter-clockwise).
PTR_RP_ROTATE180	Rotate printing 180°, that is, print upside-down.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An invalid property value was used.

See Also PrintBarCode Method

SlpBarcodeRotationList Property *Added in Release 1.1*

Syntax **BSTR SlpBarcodeRotationList;**

Remarks A string that specifies the directions in which a slip barcode may be rotated.

This property is initialized by the **Open** method. The string consists of rotation strings separated by commas. An empty string indicates that bar code printing is not supported. The legal rotation strings are:

Value	Meaning
0	Bar code may be printed in the normal orientation.
R90	Bar code may be rotated 90° to the right.
L90	Bar code may be rotated 90° to the left.
180	Bar code may be rotated 180° - upside down.

For example, if the string is "0,180", then the printer can print normal bar codes and upside down bar codes.

See Also **RotateSpecial** Property; **PrintBarcode** Method

SlpCartridgeState Property***Added in Release 1.5*****Syntax** **LONG SlpCartridgeState;****Remarks** This parameter indicate the status of the currently selected slip cartridge (ink, ribbon or toner).

Values are:

Value	Meaning
PTR_CART_UNKNOWN	Cannot determine the cartridge state, for one of the following reasons: <ul style="list-style-type: none"> • CapSlpCartridgeSensor = "0". Device does not support cartridge state reporting. • CartridgeNotify = PTR_CN_DISABLED. Cartridge state notifications are disabled. • DeviceEnabled = FALSE. Cartridge state monitoring does not occur until the device is enabled.
PTR_CART_REMOVED	The cartridge selected by SlpCurrentCartridge has been removed.
PTR_CART_EMPTY	The cartridge selected by SlpCurrentCartridge is empty.
PTR_CART_CLEANING	The head selected by SlpCurrentCartridge is being cleaned
PTR_CART_NEAREND	The cartridge selected by SlpCurrentCartridge is near end.
PTR_CART_OK	The cartridge selected by SlpCurrentCartridge is normal condition.

Note that the above mentioned values are arranged according to their priority level.

This property is initialized and kept current while the device is enabled.

See Also **SlpCurrentCartridge** Property, **CapSlpCartridgeSensor** Property, **CartridgeNotify** Property

SlpCurrentCartridge Property R/W Added in Release 1.5

Syntax **LONG SlpCurrentCartridge;**

Remarks This property specifies the currently selected Slip cartridge.

This property is initialized when the device is first enabled following the **Open** method.

This value is guaranteed to be one of the color cartridges specified by the **CapSlpColor** property. (PTR_COLOR_FULL can not be set.)

Setting **SlpCurrentCartridge** may also update **SlpCartridgeState**.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An invalid property value was used.
<i>Other Values</i>	See ResultCode .

See Also **SlpCartridgeState** Property

SlpEmpty Property

Syntax **BOOL SlpEmpty;**

Remarks If TRUE, a slip form is not present.
 If FALSE, a slip form is present.

If the capability **CapSlpEmptySensor** is FALSE, then the value of this property is always FALSE.

This property is initialized and kept current while the device is enabled.

Note

The “slip empty” sensor should be used primarily to determine whether a form has been inserted before printing, and can be monitored to determine whether a form is still in place. This sensor is usually placed one or more print lines above the slip print head.

However, the “slip near end” sensor (when present) should be used to determine when nearing the end of the slip. This sensor is usually placed one or more print lines below the slip print head.

See Also **SlpNearEnd** Property

SlpLetterQuality Property R/W

Syntax **BOOL SlpLetterQuality;**

Remarks If TRUE, prints in high quality mode.
If FALSE, prints in high speed mode.

This property advises the Service Object that either high quality or high speed printing is desired.

For example:

- Printers with bi-directional print capability may be placed in unidirectional mode for high quality, so that column alignment is more precise.
- Bitmaps may be printed in a high-density graphics mode for high-quality, and in a low-density mode for high speed.

Setting **SlpLetterQuality** may also update **SlpLineWidth**, **SlpLineHeight**, and **SlpLineSpacing** if **MapMode** is PTR_MM_DOTS. (See the footnote at **MapMode**.)

This property is initialized to FALSE when the device is first enabled following the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.

SlpLineChars Property R/W

Syntax **LONG SlpLineChars;**

Remarks The number of characters that may be printed on a slip line.

If changed to a line character width that can be supported, then the width is set to the specified value. If the exact width cannot be supported and the value is less than the maximum value allowed for the printer, then subsequent lines will be printed with a character size that most closely supports the specified characters per line. (The Service Object should print the requested characters in the column positions closest to the side of the slip table at which the slip is aligned. For example, if the operator inserts the slip with the right edge against the table side, and if **SlpLineChars** is set to 36 and the printer prints 60 characters per line, then the Service Object should add 24 spaces at the left margin, and print the characters in columns 25 through 60.)

If the character width cannot be supported and the value is greater than the maximum value allowed for the printer, then an error is returned. (For example, if set to 42 and the printer can print either 30 or 40 characters per line, then the Service Object cannot support the request.)

Setting **SlpLineChars** may also update **SlpLineWidth**, **SlpLineHeight**, and **SlpLineSpacing**, since the character pitch or font may be changed.

The value of **SlpLineChars** is initialized to the printer's default line character width when the device is first enabled following the **Open** method.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An invalid line character width was specified.

See Also **SlpLineCharsList** Property

SlpLineCharsList Property

Syntax **BSTR SlpLineCharsList;**

Remarks A string containing the line character widths supported by the slip station.

This property is initialized by the **Open** method. The string consists of ASCII numeric set numbers, separated by commas.

For example, if the string is “32,36,40”, then the station supports line widths of 32, 36, and 40 characters.

See Also **SlpLineChars** Property

SlpLineHeight Property R/W

Syntax **LONG SlpLineHeight;**

Remarks The slip print-line height. Expressed in the unit of measure given by **MapMode**.

If changed to a height that can be supported with the current character width, then the line height is set to this value. If the exact height cannot be supported, then the height is set to the closest supported value.

When **SlpLineChars** is changed, **SlpLineHeight** is updated to the default line height for the selected width.

The value of **SlpLineHeight** is initialized to the printer’s default line height when the device is first enabled following the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.

See Also **SlpLineChars** Property

SlpLinesNearEndToEnd Property

Syntax	LONG SlpLinesNearEndToEnd;
Remarks	<p>Holds the number of lines that may be printed after the “slip near end” sensor is TRUE but before the printer reaches the end of the slip.</p> <p>This property may be used to optimize the use of the slip, so that the maximum number of lines may be printed.</p> <p>Changing the SlpLineHeight, SlpLineSpacing, or SlpLineChars properties may cause this property to change.</p> <p>This property is initialized when the device is first enabled following the Open method.</p>
See Also	SlpEmpty Property; SlpNearEnd Property

SlpLineSpacing Property R/W

Syntax	LONG SlpLineSpacing;
Remarks	<p>The spacing of each single-high print line, including both the printed line height plus the whitespace between each pair of lines. Depending upon the printer and the current line spacing, a multi-high print line might exceed this value. Line spacing is expressed in the unit of measure given by MapMode.</p> <p>If changed to a spacing that can be supported by the printer, then the line spacing is set to this value. If the spacing cannot be supported, then the spacing is set to the closest supported value.</p> <p>The value of SlpLineSpacing is initialized to the printer’s default line spacing when the device is first enabled following the Open method. Also, when SlpLineChars or SlpLineHeight are changed, SlpLineSpacing is updated to the default line spacing for the selected width or height.</p>
Return	When this property is set, the following value is placed in the ResultCode property:
Value	Meaning
OPOS_SUCCESS	The property was set successfully.

SlpLineWidth Property

Syntax **LONG SlpLineWidth;**

Remarks The width of a line of **SlpLineChars** characters. Expressed in the unit of measure given by **MapMode**.

Setting **SlpLineChars** may also update **SlpLineWidth**.

The value of **SlpLineWidth** is initialized to the printer's default line width when the device is first enabled following the **Open** method.

SlpMaxLines Property

Syntax **LONG SlpMaxLines;**

Remarks Holds the maximum number of lines that can be printed on a form.

When the capability **CapSlpFullslip** is TRUE, then this value will be zero, indicating an unlimited maximum slip length.

When the capability is FALSE, then this value will be non-zero.

Changing the **SlpLineHeight**, **SlpLineSpacing**, or **SlpLineChars** properties may cause this property to change.

The value of **SlpMaxLines** is initialized when the device is first enabled following the **Open** method.

SlpNearEnd Property

Syntax **BOOL SlpNearEnd;**

Remarks If TRUE, the slip form is near its end.
If FALSE, the slip form is not near its end.

The “near end” sensor is also sometimes called the “trailing edge” sensor, referring to the bottom edge of the slip.

If the capability **CapSlpNearEndSensor** is FALSE, then the value of this property is always FALSE.

This property is initialized and kept current while the device is enabled.

Note

The “slip empty” sensor should be used primarily to determine whether a form has been inserted before printing, and can be monitored to determine whether a form is still in place. This sensor is usually placed one or more print lines above the slip print head.

However, the “slip near end” sensor (when present) should be used to determine when nearing the end of the slip. This sensor is usually placed one or more print lines below the slip print head.

See Also **SlpEmpty** Property; **SlpLinesNearEndToEnd** Property

SlpPrintSide Property***Added in Release 1.5*****Syntax** **LONG SlpPrintSide;****Remarks** Holds the current side of the slip print station document on which printing will occur.

If Slip print station is not selected, the value of the property is PTR_PS_UNKNOWN.

If a printer has both side print capability, **CapSlpBothSidePrint** is TRUE. When the Slip is inserted, the value stored here will be either PTR_PS_SIDE1 or PTR_PS_SIDE2. This property value may be changed when the **ChangePrintSide** method is executed.

If a printer does not have both side print capability, **CapSlpBothSidePrint** is FALSE, then when a slip is inserted, the property is always set to PTR_PS_SIDE1.

If a printer has both side print capability, value of **SlpPrintSide** property is PTR_PS_SIDE1 after **Begin/EndInsertion** methods are executed. However, after **Begin/EndInsertion** methods of MICR are executed, the value of **SlpPrintSide** property is not limited to PTR_PS_SIDE1. In this case, **SlpPrintSide** property indicates the validation print side.

Value	Meaning
PTR_PS_UNKNOWN	Slip print station is not selected.
PTR_PS_SIDE1	Default Print side. (After slip paper insertion, printer can print this side immediately.)
PTR_PS_SIDE2	The other side of the document to print on. (Reverse side of default.)

This property is initialized and kept current while the device is enabled.

See Also **CapSlpBothSidesPrint** Property; **ChangePrintSide** Method

SlpSidewaysMaxChars Property

Syntax	LONG SlpSidewaysMaxChars;
Remarks	<p>Holds the maximum number of characters that may be printed on each line in sideways mode.</p> <p>If the capabilities CapSlpLeft90 and CapSlpRight90 are both FALSE, then SlpSidewaysMaxChars is zero.</p> <p>Changing the properties SlpLineHeight, SlpLineSpacing, and SlpLineChars may cause this property to change.</p> <p>This property is initialized when the device is first enabled following the Open method.</p>
See Also	SlpSidewaysMaxLines Property

SlpSidewaysMaxLines Property

Syntax	LONG SlpSidewaysMaxLines;
Remarks	<p>Holds the maximum number of lines that may be printed in sideways mode.</p> <p>If the capabilities CapSlpLeft90 and CapSlpRight90 are both FALSE, then SlpSidewaysMaxLines is zero.</p> <p>Changing the properties SlpLineHeight, SlpLineSpacing, and SlpLineChars may cause this property to change.</p> <p>This property is initialized when the device is first enabled following the Open method.</p>
See Also	SlpSidewaysMaxChars Property

Methods

BeginInsertion Method

Syntax **LONG BeginInsertion (LONG *Timeout*);**

The *Timeout* parameter gives the number of milliseconds before failing the method. If zero, the method tries to begin insertion mode, then returns the appropriate status immediately.

If OPOS_FOREVER (-1), the method tries to begin insertion mode, then waits as long as needed until either the form is inserted or an error occurs.

Remarks Called to initiate slip processing.

When called, the slip station is made ready to receive a form by opening the form's handling "jaws" or activating a form insertion mode. This method is paired with the **EndInsertion** method for controlling form insertion.

If the printer device cannot be placed into insertion mode, an error is returned to the application. Otherwise, the Control continues to monitor form insertion until either:

- The form is successfully inserted. In this case, the Control returns an OPOS_SUCCESS status.
- The form is not inserted before *Timeout* milliseconds have elapsed, or an error is reported by the printer device. In this case, the Control either returns OPOS_E_TIMEOUT or another error. The printer device remains in form insertion mode. This allows an application to perform some user interaction and reissue the **BeginInsertion** method without altering the form handling mechanism.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was initiated successfully.
OPOS_E_BUSY	Cannot perform while output is in progress.
OPOS_E_ILLEGAL	The slip station does not exist (see the CapSlpPresent property) or an invalid <i>Timeout</i> parameter was specified..
OPOS_E_TIMEOUT	The specified time has elapsed without the form being properly inserted.
<i>Other Values</i>	See ResultCode .

See Also **EndInsertion** Method; **BeginRemoval** Method; **EndRemoval** Method

BeginRemoval Method

Syntax **LONG BeginRemoval (LONG *Timeout*);**

The *Timeout* property gives the number of milliseconds before failing the method. If zero, the method tries to begin removal mode, then returns the appropriate status immediately.

If OPOS_FOREVER (-1), the method tries to begin removal mode, then waits as long as needed until either the form is removed or an error occurs.

Remarks Called to initiate form removal processing.

When called, the printer is made ready to remove a form by opening the form handling “jaws” or activating a form ejection mode. This method is paired with the **EndRemoval** method for controlling form removal.

If the printer device cannot be placed into removal or ejection mode, an error is returned to the application. Otherwise, the Control continues to monitor form removal until either:

- The form is successfully removed. In this case, the Control returns an OPOS_SUCCESS status.
- The form is not removed before *Timeout* milliseconds have elapsed, or an error is reported by the printer device. In this case, the Control either returns OPOS_E_TIMEOUT or another error. The printer device remains in form removal mode. This allows an application to perform some user interaction and reissue the **BeginRemoval** method without altering the form handling mechanism.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was initiated successfully.
OPOS_E_BUSY	Cannot perform while output is in progress.
OPOS_E_ILLEGAL	The printer does not have a slip station (see the CapSlpPresent property) or an invalid <i>Timeout</i> parameter was specified..
OPOS_E_TIMEOUT	The specified time has elapsed without the form being properly removed.
<i>Other Values</i>	See ResultCode .

See Also **BeginInsertion** Method; **EndInsertion** Method; **EndRemoval** Method

ChangePrintSide Method**Added in Release 1.5****Syntax** **LONG ChangePrintSide (LONG Side);**

Side parameter indicates the current side of the document where printing will occur. A *Side* value equal to PTR_PS_SIDE1, means that the default print side of the document is selected.

(Default print side is defined as side of the document that the printer defaults to after power on. It would be the side where printing will occur immediately after the document has been inserted. Therefore, PTR_PS_SIDE1 is selected after Begin/EndInsertion is executed.)

A *Side* value equal to PTR_PS_SIDE2, means that the opposite side of the document from the one that the printer defaults to after power on is selected. (Reverse side of PTR_PS_SIDE1)

A *Side* value equal to PTR_PS_OPPOSITE means that the current printing side is switched and printing will now occur on the opposite side of the slip. (Example: If **SlpPrintSide** was PTR_PS_SIDE1, it is changed to PTR_PS_SIDE2)

Remarks Call to select the side of the document where printing is to occur.

It allows a print operation to occur on both sides of a document. This may be accomplished by mechanical paper handling of the document or multiple print heads that are positioned to print on each side of the document.

If a document is not inserted, it returns an **ERROR**

If *Side* is not **SlpPrintSide** or *Side* is PTR_PS_OPPOSITE, the side of the document is changed and the document is feed to TOF.

If *Side* is **SlpPrintSide**, nothing occurs and method returns OPOS_SUCCESS.

Executing the method may cause the **SlpPrintSide** property to change.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress.
OPOS_E_ILLEGAL	Slip print station is not present on this POS Printer. (Refer to CapSlpBothSidesPrint .)
OPOS_E_EXTENDED	ResultCodeExtended = OPOS_EPTR_COVER_OPEN: The printer cover is open.

ResultCodeExtended = OPOS_EPTR_SLP_EMPTY:
The slip station is out of paper.

ResultCodeExtended =
OPOS_EPTR_SLP_CARTRIDGE_EMPTY:
A slip cartridge is empty.

ResultCodeExtended =
OPOS_EPTR_SLP_CARTRIDGE_REMOVED:
A slip cartridge is removed.

ResultCodeExtended =
OPOS_EPTR_SLP_HEAD_CLEANING:
A slip head is being cleaned.

Other Values

See **ResultCode**.

See Also **SlpPrintSide** Property; **CapSlpBothSidesPrint** Property

CutPaper Method

Syntax **LONG CutPaper (LONG *Percentage*);**

The *Percentage* parameter indicates the percentage of paper to cut. The constant identifier PTR_CP_FULLCUT or the value 100 causes a full paper cut. Other values request a partial cut percentage.

Remarks Call to cut the receipt paper.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Many printers with paper cut capability can perform both full and partial cuts. Some offer gradations of partial cuts, such as a perforated cut and an almost-full cut. Although the exact type of cut will vary by printer capabilities, the following general guide may be used:

Value	Meaning
100	Full cut.
90	Leave only a small portion of paper for very easy final separation.
70	Perforate the paper for final separation that is somewhat more difficult and unlikely to occur by accidental handling.
50	Partial perforation of the paper.

The Service Object will select an appropriate type of cut based on the capabilities of its device and these general guidelines.

An escape sequence embedded in a **PrintNormal** or **PrintImmediate** method call may also be used to cause a paper cut.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_ILLEGAL	An invalid percentage was specified, the receipt station does not exist (see the CapRecPresent property), or the receipt printer does not have paper cutting ability (see the CapRecPapercut property).
OPOS_E_EXTENDED	<p>ResultCodeExtended = OPOS_EPTR_COVER_OPEN: The printer cover is open. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_REC_EMPTY: The receipt station is out of paper. (Can only be returned if AsyncMode is FALSE.)</p>

Other Values See **ResultCode**.

See Also “Data Characters and Escape Sequences”

EndInsertion Method

Syntax **LONG EndInsertion ();**

Remarks Called to end form insertion processing.

When called, the printer is taken out of form insertion mode. If the slip device has forms “jaws,” they are closed by this method. If a form is detected in the device, a successful status of OPOS_SUCCESS is returned to the application. If no form is present, an extended error status OPOS_EPTR_SLP_EMPTY is returned.

This method is paired with the **BeginInsertion** method for controlling form insertion. The application may choose to call this method immediately after a successful **BeginInsertion** if it wants to use the printer sensors to determine when a form is positioned within the slip printer. Alternatively, the application may prompt the user and wait for a key press before calling this method.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was initiated successfully.
OPOS_E_ILLEGAL	The printer is not in slip insertion mode.
OPOS_E_EXTENDED	ResultCodeExtended = OPOS_EPTR_COVER_OPEN: The device was taken out of insertion mode while the printer cover was open. ResultCodeExtended = OPOS_EPTR_SLP_EMPTY: The device was taken out of insertion mode without a form being inserted.
<i>Other Values</i>	See ResultCode .

See Also **BeginInsertion** Method; **BeginRemoval** Method; **EndRemoval** Method

EndRemoval Method

Syntax **LONG EndRemoval ();**

Remarks Called to end form removal processing.

When called, the printer is taken out of form removal or ejection mode. If no form is detected in the device, a successful status of OPOS_SUCCESS is returned to the application. If a form is present, an extended error status OPOS_EPTR_SLP_FORM is returned.

This method is paired with the **BeginRemoval** method for controlling form removal. The application may choose to call this method immediately after a successful **BeginRemoval** if it wants to use the printer sensors to determine when the form has been removed. Alternatively, the application may prompt the user and wait for a key press before calling this method.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was initiated successfully.
OPOS_E_ILLEGAL	The printer is not in slip removal mode.
OPOS_E_EXTENDED	ResultCodeExtended = OPOS_EPTR_SLP_FORM: The device was taken out of removal mode while a form was still present.
<i>Other Values</i>	See ResultCode .

See Also **BeginInsertion** Method; **EndInsertion** Method; **BeginRemoval** Method

MarkFeed Method***Added in Release 1.5*****Syntax** **LONG MarkFeed (LONG *Type*);***Type* parameter indicates the kind of Mark Sensed Paper handling.Valid *Type* parameter values are:

Value	Meaning
PTR_MF_TO_TAKEUP	Feed the Mark Sensed paper to the paper take-up position.
PTR_MF_TO_CUTTER	Feed the Mark Sensed paper to the auto cutter cutting position.
PTR_MF_TO_CURRENT_TOF	Feed the Mark Sensed paper to the present paper's top of form. (Reverse feed)
PTR_MF_TO_NEXT_TOF	Feed the Mark Sensed paper to the next paper's top of form.

Remarks This method is used to utilize the printer's mark sensor for receipt paper.

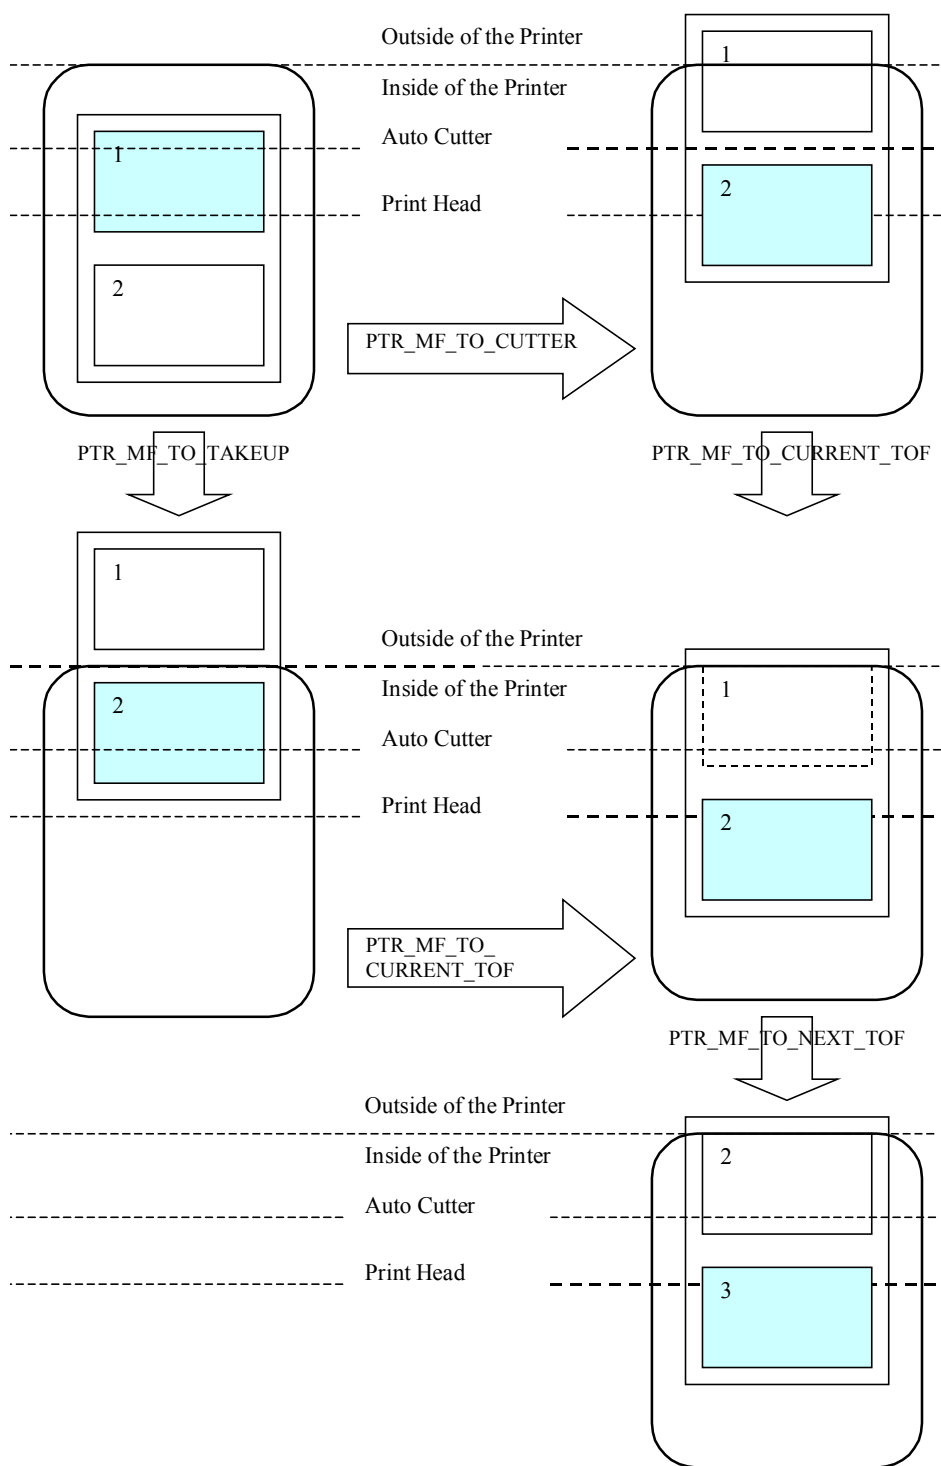

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

If *Type* is PTR_MF_TO_TAKEUP, the printer will feed the mark sensed paper so that the present form is moved so that it can be manually removed by the operator.

If *Type* is PTR_MF_TO_CUTTER, the printer will feed the mark sensed paper so that the present form is in position to be cut off by the auto cutter. This will usually be followed by a call to the CutPaper method.

If *Type* is PTR_MF_TO_CURRENT_TOF, the printer will feed the mark sensed paper (backwards if necessary) so that the print head points to the top of the present form.

If *Type* is PTR_MF_TO_NEXT_TOF, the printer will feed the mark sensed paper so that print head points to the top of the next form.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method completed successfully.
OPOS_E_ILLEGAL	Receipt print station does not support the given mark sensed paper handling function. (Refer to the CapRecMarkFeed property)
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_EXTENDED	<p>ResultCodeExtended = OPOS_EPTR_COVER_OPEN: Printer Cover is open. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_REC_EMPTY: Receipt paper is empty. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_REC_CARTRIDGE_EMPTY: A receipt cartridge is empty. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_REC_CARTRIDGE_REMOVED: A receipt cartridge is removed. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_REC_HEAD_CLEANING: A receipt head is being cleaned. (Can only be returned if AsyncMode is FALSE.)</p> <p><i>Other Values</i> See ResultCode.</p>

See Also **RecPaperType** property

PrintBarCode Method

Syntax **LONG PrintBarCode (LONG Station, BSTR Data, LONG Symbology, LONG Height, LONG Width, LONG Alignment, LONG TextPosition);**

Parameter	Description
<i>Station</i>	The printer station to be used. May be either PTR_S_RECEIPT or PTR_S_SLIP.
<i>Data</i>	Character string to be bar coded. The format of this data depends upon the value of the BinaryConversion property. See page 39.
<i>Symbology</i>	Bar code symbol type to use. See values below.
<i>Height</i>	Bar code height. Expressed in the unit of measure given by MapMode .
<i>Width</i>	Bar code width. Expressed in the unit of measure given by MapMode .
<i>Alignment</i>	Placement of the bar code. See values below.
<i>TextPosition</i>	Placement of the readable character string. See values below.

The *Alignment* parameter values are:

Value	Meaning
PTR_BC_LEFT	Align with the left-most print column.
PTR_BC_CENTER	Align in the center of the station.
PTR_BC_RIGHT	Align with the right-most print column.
<i>Other Values</i>	Distance from the left-most print column to the start of the bar code. Expressed in the unit of measure given by MapMode .

The *TextPosition* parameter values are:

Value	Meaning
PTR_BC_TEXT_NONE	No text is printed. Only print the bar code.
PTR_BC_TEXT_ABOVE	Print the text above the bar code.
PTR_BC_TEXT_BELOW	Print the text below the bar code.

The *Symbology* parameter values for this release are:

Value	Meaning
<i>One Dimensional Symbologies</i>	
PTR_BCS_UPCA	UPC-A
PTR_BCS_UPCA_S	UPC-A with supplemental barcode
PTR_BCS_UPCE	UPC-E
PTR_BCS_UPCE_S	UPC-E with supplemental barcode
PTR_BCS_UPCD1	UPC-D1
PTR_BCS_UPCD2	UPC-D2
PTR_BCS_UPCD3	UPC-D3
PTR_BCS_UPCD4	UPC-D4
PTR_BCS_UPCD5	UPC-D5
PTR_BCS_EAN8	EAN 8 (= JAN 8)
PTR_BCS_JAN8	JAN 8 (= EAN 8)
PTR_BCS_EAN8_S	EAN 8 with supplemental barcode
PTR_BCS_EAN13	EAN 13 (= JAN 13)
PTR_BCS_JAN13	JAN 13 (= EAN 13)
PTR_BCS_EAN13_S	EAN 13 with supplemental barcode
PTR_BCS_EAN128	EAN-128
PTR_BCS_TF	Standard (or discrete) 2 of 5
PTR_BCS_ITF	Interleaved 2 of 5
PTR_BCS_Codabar	Codabar

PTR_BCS_Code39	Code 39
PTR_BCS_Code93	Code 93
PTR_BCS_Code128	Code 128
PTR_BCS_OCRA	OCR “A”
PTR_BCS_OCRB	OCR “B”

Two Dimensional Symbolologies

PTR_BCS_PDF417	PDF 417
PTR_BCS_MAXICODE	MAXICODE

Special Cases

PTR_BCS_OTHER	If a Service Object defines additional symbolologies, they will be greater or equal to this value.
---------------	--

Remarks Call to print a bar code on the specified printer station.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

If the property **RotateSpecial** indicates that the bar code is to be rotated, then perform the rotation. The *Height*, *Width*, and *TextPosition* parameters are applied to the bar code before the rotation. For example, if PTR_BC_TEXT_BELOW is specified and the bar code is rotated left, then the text will appear on the paper to the right of the bar code.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none">• <i>Station</i> does not exist• <i>Station</i> does not support bar code printing• <i>Height</i> or <i>Width</i> are zero or too big• <i>Symbology</i> is not supported• <i>Alignment</i> is invalid or too big• <i>TextPosition</i> is invalid• The RotateSpecial rotation is not supported
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)

OPOS_E_EXTENDED **ResultCodeExtended** = OPOS_EPTR_COVER_OPEN:

The printer cover is open.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EPTR_REC_EMPTY:

The receipt station was specified but is out of paper.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended =

OPOS_EPTR_REC_CARTRIDGE_EMPTY:

A receipt cartridge is empty.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended =

OPOS_EPTR_REC_CARTRIDGE_REMOVED:

A receipt cartridge is removed.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended =

OPOS_EPTR_REC_HEAD_CLEANING:

A receipt head is being cleaned.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EPTR_SLP_EMPTY:

The slip station was specified, but a form is not inserted.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended =

OPOS_EPTR_SLP_CARTRIDGE_EMPTY:

A slip cartridge is empty.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended =

OPOS_EPTR_SLP_CARTRIDGE_REMOVED:

A slip cartridge is removed.

(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended =

OPOS_EPTR_SLP_HEAD_CLEANING:

A slip head is being cleaned.

(Can only be returned if **AsyncMode** is FALSE.)

Other Values

See **ResultCode**.

PrintBitmap Method

Syntax **LONG PrintBitmap (LONG Station, BSTR FileName, LONG Width, LONG Alignment);**

Parameter	Description
<i>Station</i>	The printer station to be used. May be either PTR_S_RECEIPT or PTR_S_SLIP.
<i>FileName</i>	Name of Windows bitmap file. The file must be in uncompressed format.
<i>Width</i>	Printed width of the bitmap to be performed. See values below.
<i>Alignment</i>	Placement of the bitmap. See values below.

The *Width* parameter values are:

Value	Meaning
PTR_BM_ASIS	Print the bitmap with one bitmap pixel per printer dot.
<i>Other Values</i>	Bitmap width expressed in the unit of measure given by MapMode .

The *Alignment* parameter values are:

Value	Meaning
PTR_BM_LEFT	Align with the left-most print column.
PTR_BM_CENTER	Align in the center of the station.
PTR_BM_RIGHT	Align with the right-most print column.
<i>Other Values</i>	Distance from the left-most print column to the start of the bitmap. Expressed in the unit of measure given by MapMode .

Remarks Call to print a bitmap on the specified printer station.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

The *Width* parameter controls transformation of the bitmap. If *Width* is PTR_BM_ASIS, then no transformation is performed. The bitmap is printed with one bitmap pixel per printer dot. Advantages of this option are that it:

- Provides the highest performance bitmap printing.
- Works well for bitmaps tuned for a specific printer's aspect ratio between horizontal dots and vertical dots.

If *Width* is non-zero, then the bitmap will be transformed by stretching or compressing the bitmap such that its width is the specified width and the aspect ratio is unchanged. Advantages of this option are that it:

- Sizes a bitmap to fit a variety of printers.
- Maintains the bitmap's aspect ratio.

Disadvantages are:

- Lower performance than untransformed data.
- Some lines and images that are "smooth" in the original bitmap may show some "ratcheting."

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> • <i>Station</i> does not exist • <i>Station</i> does not support bitmap printing • <i>Width</i> parameter is invalid or too big • <i>Alignment</i> is invalid or too big
OPOS_E_NOEXIST	<i>FileName</i> was not found.
OPOS_E_EXTENDED	<p>ResultCodeExtended = OPOS_EPTR_TOOBIG: The bitmap is either too wide to print without transformation, or it is too big to transform.</p> <p>ResultCodeExtended = OPOS_EPTR_COVER_OPEN: The printer cover is open. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_BADFORMAT: The specified file is either not a bitmap file, or it is in an unsupported format.</p> <p>ResultCodeExtended = OPOS_EPTR_REC_EMPTY: The receipt station was specified but is out of paper. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_REC_CARTRIDGE_EMPTY: A receipt cartridge is empty. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_REC_CARTRIDGE_REMOVED: A receipt cartridge is removed. (Can only be returned if AsyncMode is FALSE.)</p>

ResultCodeExtended =
OPOS_EPTR_REC_HEAD_CLEANING:
A receipt head is being cleaned.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EPTR_SLP_EMPTY:
The slip station was specified, but a form is not inserted.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended =
OPOS_EPTR_SLP_CARTRIDGE_EMPTY:
A slip cartridge is empty.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended =
OPOS_EPTR_SLP_CARTRIDGE_REMOVED:
A slip cartridge is removed.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended =
OPOS_EPTR_SLP_HEAD_CLEANING:
A slip head is being cleaned.
(Can only be returned if **AsyncMode** is FALSE.)

Other Values

See **ResultCode**.

PrintImmediate Method

Syntax **LONG PrintImmediate (LONG Station, BSTR Data);**

Station The printer station to be used. May be PTR_S_JOURNAL, PTR_S_RECEIPT, or PTR_S_SLIP.

Data The characters to be printed. May consist of printable characters, escape sequences, carriage returns (13 decimal), and newline / line feed (10 decimal). The format of this data depends upon the value of the **BinaryConversion** property. See page 39.

Remarks Call to print *Data* on the printer *Station* immediately.

This method tries to print its data immediately – that is, as the very next printer operation. It may be called when asynchronous output is outstanding.

PrintImmediate is primarily intended for use in exception conditions when asynchronous output is outstanding, such as within an error event handler.

Special character values within *Data* are:

Value	Meaning
Newline / Line Feed (10 Decimal)	Print any data in the line buffer, and feed to the next print line. (A Carriage Return is not required in order to cause the line to be printed.)
Carriage Return (13 Decimal)	<p>If a Carriage Return immediately precedes a Line Feed, or if the line buffer is empty, then it is ignored.</p> <p>Otherwise, the line buffer is printed and the printer does not feed to the next print line. On some printers, print without feed may be directly supported.</p> <p>On others, a print may always feed to the next line, in which case the Service Object will print the line buffer and perform a reverse line feed if supported.</p> <p>If the printer does not support either of these features, then Carriage Return acts like a Line Feed.</p> <p>The ValidateData method may be used to determine whether a Carriage Return without Line Feed is possible, and whether a reverse line feed is required to support it.</p>

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	The specified <i>Station</i> does not exist. (See the CapJrnPresent , CapRecPresent , and CapSlpPresent properties.)
OPOS_E_EXTENDED	<p>ResultCodeExtended = OPOS_EPTR_COVER_OPEN: The printer cover is open.</p> <p>ResultCodeExtended = OPOS_EPTR_JRN_EMPTY: The journal station was specified but is out of paper.</p> <p>ResultCodeExtended = OPOS_EPTR_JRN_CARTRIDGE_EMPTY: A journal cartridge is empty.</p> <p>ResultCodeExtended = OPOS_EPTR_JRN_CARTRIDGE_REMOVED: A journal cartridge is removed.</p> <p>ResultCodeExtended = OPOS_EPTR_JRN_HEAD_CLEANING: A journal head is being cleaned.</p> <p>ResultCodeExtended = OPOS_EPTR_REC_EMPTY: The receipt station was specified but is out of paper.</p> <p>ResultCodeExtended = OPOS_EPTR_REC_CARTRIDGE_EMPTY: A receipt cartridge is empty.</p> <p>ResultCodeExtended = OPOS_EPTR_REC_CARTRIDGE_REMOVED: A receipt cartridge is removed.</p> <p>ResultCodeExtended = OPOS_EPTR_REC_HEAD_CLEANING: A receipt head is being cleaned.</p>

ResultCodeExtended = OPOS_EPTR_SLP_EMPTY:
The slip station was specified, but a form is not inserted.

ResultCodeExtended =
OPOS_EPTR_SLP_CARTRIDGE_EMPTY:
A slip cartridge is empty.

ResultCodeExtended =
OPOS_EPTR_SLP_CARTRIDGE_REMOVED:
A slip cartridge is removed.

ResultCodeExtended =
OPOS_EPTR_SLP_HEAD_CLEANING:
A slip head is being cleaned.

Other Values

See **ResultCode**.

See Also **PrintNormal** Method; **PrintTwoNormal** Method

PrintNormal Method

Syntax **LONG PrintNormal (LONG Station, BSTR Data);**

Station The printer station to be used. May be PTR_S_JOURNAL, PTR_S_RECEIPT, or PTR_S_SLIP.

Data The characters to be printed. May consist of printable characters, escape sequences, carriage returns (13 decimal), and newline / line feed (10 decimal). The format of this data depends upon the value of the **BinaryConversion** property. See page 39.

Remarks Call to print *Data* on the printer *Station*.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Special character values within *Data* are:

Value	Meaning
Newline / Line Feed (10 Decimal)	Print any data in the line buffer, and feed to the next print line. (A Carriage Return is not required in order to cause the line to be printed.)
Carriage Return (13 Decimal)	<p>If a Carriage Return immediately precedes a Line Feed, or if the line buffer is empty, then it is ignored.</p> <p>Otherwise, the line buffer is printed and the printer does not feed to the next print line. On some printers, print without feed may be directly supported.</p> <p>On others, a print may always feed to the next line, in which case the Service Object will print the line buffer and perform a reverse line feed if supported.</p> <p>If the printer does not support either of these features, then Carriage Return acts like a Line Feed.</p> <p>The ValidateData method may be used to determine whether a Carriage Return without Line Feed is possible, and whether a reverse line feed is required to support it.</p>

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	The specified <i>Station</i> does not exist. (See the CapJrnPresent , CapRecPresent , and CapSlpPresent properties.)
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_EXTENDED	<p>ResultCodeExtended = OPOS_EPTR_COVER_OPEN: The printer cover is open. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_JRN_EMPTY: The journal station was specified but is out of paper. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_JRN_CARTRIDGE_EMPTY: A journal cartridge is empty. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_JRN_CARTRIDGE_REMOVED: A journal cartridge is removed. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_JRN_HEAD_CLEANING: A journal head is being cleaned. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_REC_EMPTY: The receipt station was specified but is out of paper. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_REC_CARTRIDGE_EMPTY: A receipt cartridge is empty. (Can only be returned if AsyncMode is FALSE.)</p>

ResultCodeExtended =
OPOS_EPTR_REC_CARTRIDGE_REMOVED:
A receipt cartridge is removed.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended =
OPOS_EPTR_REC_HEAD_CLEANING:
A receipt head is being cleaned.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EPTR_SLP_EMPTY:
The slip station was specified, but a form is not inserted.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended =
OPOS_EPTR_SLP_CARTRIDGE_EMPTY:
A slip cartridge is empty.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended =
OPOS_EPTR_SLP_CARTRIDGE_REMOVED:
A slip cartridge is removed.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended =
OPOS_EPTR_SLP_HEAD_CLEANING:
A slip head is being cleaned.
(Can only be returned if **AsyncMode** is FALSE.)

Other Values

See **ResultCode**.

See Also **PrintImmediate** Method; **PrintTwoNormal** Method

PrintTwoNormal Method

Syntax **LONG PrintTwoNormal (LONG Stations, BSTR Data1, BSTR Data2);**

Parameter	Description
-----------	-------------

Stations

The printer stations to be used.

OPOS Release 1.3 and later:

Select one of the following:

<i>Stations</i> Parameter	First Station	Second Station
PTR_TWO_RECEIPT_JOURNAL	Receipt	Journal
PTR_TWO_SLIP_JOURNAL	Slip	Journal
PTR_TWO_SLIP_RECEIPT	Slip	Receipt

OPOS Release 1.0 - 1.2:

Select one of the following:

PTR_S_JOURNAL_RECEIPT,
PTR_S_JOURNAL_SLIP, or
PTR_S_RECEIPT_SLIP.

Data1

The characters to be printed on the first station. May consist of printable characters and escape sequences as listed in the “Print Line” Table under “Data Characters and Escape Sequences” on page 627. The characters must all fit on one printed line, so that the printer may attempt to print on both stations simultaneously.

The format of this data depends upon the value of the **BinaryConversion** property. See page 39.

Data2

The characters to be printed on the second station. (Restrictions are the same as *Data1*.)

If this string is the empty string (“”), then print the same data as *Data1*. On some printers, using this format may give additional increased print performance.

The format of this data depends upon the value of the **BinaryConversion** property. See page 39.

Remarks Call to print two strings on two print stations simultaneously. When supported, this may give increased print performance.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Release 1.0 – 1.2

Documentation releases prior to 1.3 were not sufficiently clear as to the meaning of “first” and “second” station, so implementations varied between the following:

- Assign stations based on order within the constants. For example, PTR_S_JOURNAL_RECEIPT prints *Data1* on the journal and *Data2* on the receipt.
- Assign stations based upon physical device characteristics or internal print order.

Due to this inconsistency, the application should use the new constants if the Control Object and Service Object versions indicate Release 1.3 or later.

Release 1.3 and later

Service Objects for Release 1.3 or later should support both sets of constants. The vendor should define and document the behavior of the obsolete constants.

The sequence of stations in the constants does not imply the physical printing sequence on the stations. The physical sequence depends on the printer, and may be different based on bi-directional printing, multiple print heads, and so on.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	The specified <i>Stations</i> do not support concurrent printing. (See the CapConcurrentJrnRec , CapConcurrentJrnSlp , and CapConcurrentRecSlp properties.)
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_EXTENDED	<p>ResultCodeExtended = OPOS_EPTR_COVER_OPEN: The printer cover is open. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_JRN_EMPTY: The journal station was specified but is out of paper. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_JRN_CARTRIDGE_EMPTY: A journal cartridge is empty. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_JRN_CARTRIDGE_REMOVED: A journal cartridge is removed. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_JRN_HEAD_CLEANING: A journal head is being cleaned. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_REC_EMPTY: The receipt station was specified but is out of paper. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_REC_CARTRIDGE_EMPTY: A receipt cartridge is empty. (Can only be returned if AsyncMode is FALSE.)</p>

ResultCodeExtended =
OPOS_EPTR_REC_CARTRIDGE_REMOVED:
A receipt cartridge is removed.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended =
OPOS_EPTR_REC_HEAD_CLEANING:
A receipt head is being cleaned.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended = OPOS_EPTR_SLP_EMPTY:
The slip station was specified, but a form is not inserted.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended =
OPOS_EPTR_SLP_CARTRIDGE_EMPTY:
A slip cartridge is empty.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended =
OPOS_EPTR_SLP_CARTRIDGE_REMOVED:
A slip cartridge is removed.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended =
OPOS_EPTR_SLP_HEAD_CLEANING:
A slip head is being cleaned.
(Can only be returned if **AsyncMode** is FALSE.)

Other Values

See **ResultCode**.

See Also **PrintNormal** Method

RotatePrint Method

Syntax **LONG RotatePrint (LONG Station, LONG Rotation);**

Parameter	Description
<i>Station</i>	The printer station to be used. May be PTR_S_RECEIPT or PTR_S_SLIP.
<i>Rotation</i>	Direction of rotation. See values below.
Value	Meaning
PTR_RP_RIGHT90	Rotate printing 90° to the right (clockwise).
PTR_RP_LEFT90	Rotate printing 90° to the left (counter-clockwise).
PTR_RP_ROTATE180	Rotate printing 180°, that is, print upside-down.
PTR_RP_NORMAL	End rotated printing.

Remarks

Enters or exits rotated print mode.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

If *Rotation* is PTR_RP_ROTATE180, then upside-down print mode is entered. Subsequent calls to **PrintNormal** or **PrintImmediate** will print the data upside-down until **RotatePrint** is called with the *Rotation* parameter set to PTR_RP_NORMAL.

Each print line is rotated by 180°. Lines are printed in the order that they are sent to the Control, with the start of each line justified at the right margin of the printer station. Only print methods **PrintNormal** and **PrintImmediate** may be used while in upside-down print mode.

If *Rotation* is PTR_RP_RIGHT90 or PTR_RP_LEFT90, then sideways print mode is entered. Subsequent calls to **PrintNormal** will buffer the print data (either at the printer or the Service Object, depending on the printer capabilities) until **RotatePrint** is called with the *Rotation* parameter set to PTR_RP_NORMAL. (In this case, **PrintNormal** only buffers the data – it does not initiate printing. Also, the value of the **AsyncMode** property does not affect its operation: No **OutputID** will be assigned to the request, nor will an **OutputCompleteEvent** be fired.)

Each print line is rotated by 90°. If the lines are not all the same length, then they are justified at the start of each line. Only **PrintNormal** may be used while in sideways print mode.

If *Rotation* is PTR_RP_NORMAL, then rotated print mode is exited. If sideways-rotated print mode was in effect and some data was buffered by calls to the **PrintNormal** method, then the buffered data is printed. The entire rotated block of lines are treated as one message.

Changing the rotation mode may also change the station's line height, line spacing, line width, and other metrics.

Calling the **ClearOutput** method cancels rotated print mode. Any buffered sideways rotated print lines are also cleared.

Return One of the values in the following table is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	The specified <i>Station</i> does not exist (see the CapJrnPresent , CapRecPresent , and CapSlpPresent properties), or the <i>Station</i> does not support the specified rotation (see the station's rotation capability properties).
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE.)
OPOS_E_EXTENDED	<p>ResultCodeExtended = OPOS_EPTR_COVER_OPEN: The printer cover is open. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_REC_EMPTY: The receipt station was specified but is out of paper. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_REC_CARTRIDGE_EMPTY: A receipt cartridge is empty. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_REC_CARTRIDGE_REMOVED: A receipt cartridge is removed. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_REC_HEAD_CLEANING: A receipt head is being cleaned. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_SLP_EMPTY: The slip station was specified, but a form is not inserted. (Can only be returned if AsyncMode is FALSE.)</p> <p>ResultCodeExtended = OPOS_EPTR_SLP_CARTRIDGE_EMPTY: A slip cartridge is empty. (Can only be returned if AsyncMode is FALSE.)</p>

ResultCodeExtended =
 OPOS_EPTR_SLP_CARTRIDGE_REMOVED:
 A slip cartridge is removed.
 (Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended =
 OPOS_EPTR_SLP_HEAD_CLEANING:
 A slip head is being cleaned.
 (Can only be returned if **AsyncMode** is FALSE.)

Other Values See **ResultCode**.

See Also “Data Characters and Escape Sequences”

SetBitmap Method

Syntax **LONG SetBitmap (LONG BitmapNumber, LONG Station, BSTR FileName, LONG Width, LONG Alignment);**

Parameter	Description
<i>BitmapNumber</i>	The number to be assigned to this bitmap. Two bitmaps, numbered 1 and 2, may be set.
<i>Station</i>	The printer station to be used. May be either PTR_S_RECEIPT or PTR_S_SLIP.
<i>FileName</i>	Name of Windows bitmap file. The file must be in uncompressed format. If set to an empty string (“”), then the bitmap is unset.
<i>Width</i>	Printed width of the bitmap to be performed. See PrintBitmap for values.
<i>Alignment</i>	Placement of the bitmap. See PrintBitmap for values.

Remarks Call to save information about a bitmap for later printing.

The bitmap may then be printed by calling the **PrintNormal** or **PrintImmediate** method with the print bitmap escape sequence in the print data. The print bitmap escape sequence will typically be included in a string for printing top and bottom transaction headers.

A Service Object may choose to cache the bitmap for later use to provide better performance. Regardless, the bitmap file and parameters are validated for correctness by this method.

The application must ensure that the printer station metrics, such as character width, line height, and line spacing are set for the *Station* before calling this method. The Service Object may perform transformations on the bitmap in preparation for later printing based upon the current values.

Release 1.0 – 1.1

Only 2 bitmaps may be set, and each bitmap number may only be used for one station at a time.

Release 1.2 and later

The application may set bitmaps numbered 1 and 2 for each of the two valid *Stations*. If desired, the same bitmap *FileName* may be set to the same *BitmapNumber* for each station, so that the same print bitmap escape sequence may be used for either station.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> • <i>BitmapNumber</i> is invalid • <i>Station</i> does not exist • <i>Station</i> does not support bitmap printing • <i>Width</i> is too big • <i>Alignment</i> is invalid or too big
OPOS_E_NOEXIST	<i>FileName</i> was not found.
OPOS_E_EXTENDED	ResultCodeExtended = OPOS_EPTR_TOOBIG: The bitmap is either too wide to print without transformation, or it is too big to transform. ResultCodeExtended = OPOS_EPTR_BADFORMAT: The specified file is either not a bitmap file, or it is in an unsupported format.
<i>Other Values</i>	See ResultCode .

See Also “Data Characters and Escape Sequences”; **PrintBitmap** Method

SetLogo Method

Syntax **LONG SetLogo (LONG Location, BSTR Data);**

Parameter	Description
<i>Location</i>	The logo to be set. May be PTR_L_TOP or PTR_L_BOTTOM.
<i>Data</i>	The characters that produce the logo. May consist of printable characters, escape sequences, carriage returns (13 decimal), and newline / line feed (10 decimal). The format of this data depends upon the value of the BinaryConversion property. See page 39.

Remarks	<p>Call to save a data string as the top or bottom logo.</p> <p>A logo may then be printed by calling the PrintNormal, PrintTwoNormal, or PrintImmediate method with the print top logo or print bottom logo escape sequence in the print data.</p>								
Return	<p>One of the following values is returned by the method and placed in the ResultCode property:</p> <table> <tr> <th>Value</th><th>Meaning</th></tr> <tr> <td>OPOS_SUCCESS</td><td>The method was successful.</td></tr> <tr> <td>OPOS_E_ILLEGAL</td><td>An invalid <i>Location</i> was specified.</td></tr> <tr> <td><i>Other Values</i></td><td>See ResultCode.</td></tr> </table>	Value	Meaning	OPOS_SUCCESS	The method was successful.	OPOS_E_ILLEGAL	An invalid <i>Location</i> was specified.	<i>Other Values</i>	See ResultCode .
Value	Meaning								
OPOS_SUCCESS	The method was successful.								
OPOS_E_ILLEGAL	An invalid <i>Location</i> was specified.								
<i>Other Values</i>	See ResultCode .								
See Also	“Data Characters and Escape Sequences”								

TransactionPrint Method***Added in Release 1.1***

Syntax	LONG TransactionPrint (LONG <i>Station</i>, LONG <i>Control</i>);						
	<table> <tr> <th>Parameter</th><th>Description</th></tr> <tr> <td><i>Station</i></td><td>The printer station to be used. May be PTR_S_JOURNAL, PTR_S_RECEIPT, or PTR_S_SLIP.</td></tr> <tr> <td><i>Control</i></td><td>Transaction control. See values below.</td></tr> </table>	Parameter	Description	<i>Station</i>	The printer station to be used. May be PTR_S_JOURNAL, PTR_S_RECEIPT, or PTR_S_SLIP.	<i>Control</i>	Transaction control. See values below.
Parameter	Description						
<i>Station</i>	The printer station to be used. May be PTR_S_JOURNAL, PTR_S_RECEIPT, or PTR_S_SLIP.						
<i>Control</i>	Transaction control. See values below.						
	<table> <tr> <th>Value</th><th>Meaning</th></tr> <tr> <td>PTR_TP_TRANSACTION</td><td>Begin a transaction.</td></tr> <tr> <td>PTR_TP_NORMAL</td><td>End a transaction by printing the buffered data.</td></tr> </table>	Value	Meaning	PTR_TP_TRANSACTION	Begin a transaction.	PTR_TP_NORMAL	End a transaction by printing the buffered data.
Value	Meaning						
PTR_TP_TRANSACTION	Begin a transaction.						
PTR_TP_NORMAL	End a transaction by printing the buffered data.						

Remarks Enters or exits transaction mode.

If *Control* is PTR_TP_TRANSACTION, then transaction mode is entered. Subsequent calls to **PrintNormal**, **CutPaper**, **RotatePrint**, **PrintBarCode**, **PrintBitmap** and **MarkFeed** will buffer the print data (either at the printer or the Service Object, depending on the printer capabilities) until **TransactionPrint** is called with the *Control* parameter set to PTR_TP_NORMAL. (In this case, the print methods only validate the method parameters and buffer the data – they do not initiate printing. Also, the value of the **AsyncMode** property does not affect their operation: No **OutputID** will be assigned to the request, nor will an **OutputCompleteEvent** be fired.)

If *Control* is PTR_TP_NORMAL, then transaction mode is exited. If some data was buffered by calls to the methods **PrintNormal**, **CutPaper**, **RotatePrint**, **PrintBarCode**, **PrintBitmap** and **MarkFeed**, then the buffered data is printed. The entire transaction is treated as one message. This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Calling the **ClearOutput** method cancels transaction mode. Any buffered print lines are also cleared.

Return One of the values in the following table is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	The specified <i>Station</i> does not exist (see the CapJrnPresent , CapRecPresent , and CapSlpPresent properties), or CapTransaction is FALSE.
OPOS_E_BUSY	Cannot perform while output is in progress. (Can only be returned if AsyncMode is FALSE and <i>Control</i> is PTR_TP_NORMAL.)
OPOS_E_EXTENDED	<p>ResultCodeExtended = OPOS_EPTR_COVER_OPEN: The printer cover is open. (Can only be returned if AsyncMode is FALSE and <i>Control</i> is PTR_TP_NORMAL.)</p> <p>ResultCodeExtended = OPOS_EPTR_JRN_EMPTY: The journal station was specified but is out of paper. (Can only be returned if AsyncMode is FALSE and <i>Control</i> is PTR_TP_NORMAL.)</p> <p>ResultCodeExtended = OPOS_EPTR_JRN_CARTRIDGE_EMPTY: A journal cartridge is empty. (Can only be returned if AsyncMode is FALSE and <i>Control</i> is PTR_TP_NORMAL.)</p> <p>ResultCodeExtended = OPOS_EPTR_JRN_CARTRIDGE_REMOVED: A journal cartridge is removed. (Can only be returned if AsyncMode is FALSE and <i>Control</i> is PTR_TP_NORMAL.)</p> <p>ResultCodeExtended = OPOS_EPTR_JRN_HEAD_CLEANING: A journal head is being cleaned. (Can only be returned if AsyncMode is FALSE and <i>Control</i> is PTR_TP_NORMAL.)</p>

ResultCodeExtended = OPOS_EPTR_REC_EMPTY:
The receipt station was specified but is out of paper.
(Can only be returned if **AsyncMode** is FALSE and
Control is PTR_TP_NORMAL.)

ResultCodeExtended =
OPOS_EPTR_REC_CARTRIDGE_EMPTY:
A receipt cartridge is empty.
(Can only be returned if **AsyncMode** is FALSE.)

ResultCodeExtended =
OPOS_EPTR_REC_CARTRIDGE_REMOVED:
A receipt cartridge is removed.
(Can only be returned if **AsyncMode** is FALSE and
Control is PTR_TP_NORMAL.)

ResultCodeExtended =
OPOS_EPTR_REC_HEAD_CLEANING:
A receipt head is being cleaned.
(Can only be returned if **AsyncMode** is FALSE and
Control is PTR_TP_NORMAL.)

ResultCodeExtended = OPOS_EPTR_SLP_EMPTY:
The slip station was specified, but a form is not inserted.
(Can only be returned if **AsyncMode** is FALSE and
Control is PTR_TP_NORMAL.)

ResultCodeExtended =
OPOS_EPTR_SLP_CARTRIDGE_EMPTY:
A slip cartridge is empty.
(Can only be returned if **AsyncMode** is FALSE and
Control is PTR_TP_NORMAL.)

ResultCodeExtended =
OPOS_EPTR_SLP_CARTRIDGE_REMOVED:
A slip cartridge is removed.
(Can only be returned if **AsyncMode** is FALSE and
Control is PTR_TP_NORMAL.)

ResultCodeExtended =
OPOS_EPTR_SLP_HEAD_CLEANING:
A slip head is being cleaned.
(Can only be returned if **AsyncMode** is FALSE and
Control is PTR_TP_NORMAL.)

*Other Values*See **ResultCode**.**ValidateData Method*****Added in Release 1.1*****Syntax** **LONG ValidateData (LONG Station, BSTR Data);**

Parameter	Description
<i>Station</i>	The printer station to be used. May be PTR_S_JOURNAL, PTR_S_RECEIPT, or PTR_S_SLIP.
<i>Data</i>	The data to be validated. May include printable data and escape sequences. The format of this data depends upon the value of the BinaryConversion property. See page 39.

Remarks Call to determine whether a data sequence, possibly including one or more escape sequences, is valid for the specified station, before calling the **PrintImmediate**, **PrintNormal**, or **PrintTwoNormal** methods.

This method does not cause any printing, but is used to determine the capabilities of the station.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The data is valid.
OPOS_E_ILLEGAL	Some of data is not precisely supported by the printer station, but the Control can select valid alternatives.
OPOS_E_FAILURE	Some of the data is not supported. No alternatives can be selected.

Cases which cause OPOS_E_ILLEGAL to be returned are:

Escape Sequence	Condition
Paper cut	The percentage '#' is not precisely supported: Control will select the closest supported value.
Feed and Paper cut	The percentage '#' is not precisely supported: Control will select the closest supported value.
Feed, Paper cut, and Stamp	The percentage '#' is not precisely supported: Control will select the closest supported value.
Feed units	The unit count '#' is not precisely supported: Control will select the closest supported value.
Feed reverse	The line count '#' is too large: Control will select the maximum supported value.
Underline	The thickness '#' is not precisely supported: Control will select the closest supported value.
Shading	The percentage '#' is not precisely supported: Control will select the closest supported value.
Scale horizontally	The scaling factor '#' is not supported: Control will select the closest supported value.
Scale vertically	The scaling factor '#' is not supported: Control will select the closest supported value.
Data	Condition
<i>data1</i> CR <i>data2</i> LF	(Where CR is a Carriage Return and LF is a Line Feed) In order to print data <i>data1</i> and remain on the same line, the Service Object will print with a line advance, then perform a reverse line feed. The data <i>data2</i> will then overprint <i>data1</i> .

Cases which will cause OPOS_E_FAILURE to be returned are:

Escape Sequence	Condition
(General)	The escape sequence format is not valid.
Paper cut	Not supported.
Feed and Paper cut	Not supported.
Feed, Paper cut, and Stamp	Not supported.
Fire stamp	Not supported.
Print bitmap	Bitmap printing is not supported, or the bitmap number '#' is out of range.
Feed reverse	Not supported.
Font typeface	The typeface '#' is not supported:
Bold	Not supported.
Underline	Not supported.
Italic	Not supported.
Alternate color	Not supported.
Reverse video	Not supported.
Shading	Not supported.
Single high & wide	Not supported.
Double wide	Not supported.
Double high	Not supported.
Double high & wide	Not supported.
RGB color	Not supported.
Data	Condition
<i>data1</i> CR <i>data2</i> LF	(Where CR is a Carriage Return and LF is a Line Feed) Not able to print data and remain on the same line. The data <i>data1</i> will print on one line, and the data <i>data2</i> will print on the next line.

See Also “Data Characters and Escape Sequences”

Events

ErrorEvent Event

Syntax **void ErrorEvent (LONG *ResultCode*, LONG *ResultCodeExtended*, LONG *ErrorLocus*, LONG* *pErrorResponse*);**

Parameter	Description
<i>ResultCode</i>	Result code causing the error event. See ResultCode for values.
<i>ResultCodeExtended</i>	Extended result code causing the error event. See values below.
<i>ErrorLocus</i>	Set to OPOS_EL_OUTPUT: Error occurred while processing asynchronous output.
<i>pErrorResponse</i>	Pointer to the error event response. See values below.

If *ResultCode* is OPOS_E_EXTENDED, then *ResultCodeExtended* is set to one of the following values:

Value	Meaning
OPOS_EPTR_COVER_OPEN	The printer cover is open.
OPOS_EPTR_JRN_EMPTY	The journal station is out of paper.
OPOS_EPTR_REC_EMPTY	The receipt station is out of paper.
OPOS_EPTR_SLP_EMPTY	A form is not inserted in the slip station.
OPOS_EPTR_JRN_CARTRIDGE_REMOVED	The journal station cartridge is not present.
OPOS_EPTR_JRN_CARTRIDGE_EMPTY	The journal cartridge is empty.
OPOS_EPTR_JRN_HEAD_CLEANING	The journal station head is being cleaned.
OPOS_EPTR_REC_CARTRIDGE_REMOVED	The receipt station cartridge is not present.
OPOS_EPTR_REC_CARTRIDGE_EMPTY	The receipt cartridge is empty.

OPOS_EPTR_REC_HEAD_CLEANING

The receipt station head is being cleaned.

OPOS_EPTR_SLP_CARTRIDGE_REMOVED

The slip station cartridge is not present.

OPOS_EPTR_SLP_CARTRIDGE_EMPTY

The slip cartridge is empty.

OPOS_EPTR_SLP_HEAD_CLEANING

The slip station head is being cleaned.

The contents at the location pointed to by the *pErrorResponse* parameter are preset to the default value of OPOS_ER_RETRY. The application may set the value to one of the following:

Value	Meaning
OPOS_ER_RETRY	Retry the asynchronous output. The error state is exited.
OPOS_ER_CLEAR	Clear the asynchronous output. The error state is exited.

Remarks Fired when an error is detected and the Control's **State** transitions into the error state.

See Also "Status, Result Code, and State Model"

StatusUpdateEvent Event

Syntax **void StatusUpdateEvent (LONG *Status*);**

The *Status* parameter may be one of the following:

Value	Meaning
PTR_SUE_COVER_OPEN	Printer cover is open.
PTR_SUE_COVER_OK	Printer cover is closed.
PTR_SUE_JRN_EMPTY	No journal paper.
PTR_SUE_JRN_NEAREMPTY	Journal paper is low.
PTR_SUE_JRN_PAPEROK	Journal paper is ready.
PTR_SUE_REC_EMPTY	No receipt paper.
PTR_SUE_REC_NEAREMPTY	Receipt paper is low.
PTR_SUE_REC_PAPEROK	Receipt paper is ready.
PTR_SUE_SLP_EMPTY	No slip form.
PTR_SUE_SLP_NEAREMPTY	Almost at the bottom of the slip form.
PTR_SUE_SLP_PAPEROK	Slip form is inserted.
PTR_SUE_IDLE	All asynchronous output has finished, either successfully or because output has been cleared. The printer State is now OPOS_S_IDLE. The FlagWhenIdle property must be TRUE for this event to be fired, and the Control automatically resets the property to FALSE just before delivering the event.

Release 1.5 and later – Cartridge State Reporting

If **CartridgeNotify** = PTR_CN_ENABLED, **StatusUpdateEvents** with the following *Status* parameter values may be fired.

Value	Meaning
PTR_SUE_JRN_CARTRIDGE_EMPTY	A journal cartridge needs to be replaced. Cartridge is empty or not present.
PTR_SUE_JRN_CARTRIDGE_NEAREMPTY	A journal cartridge is near end.
PTR_SUE_JRN_HEAD_CLEANING	A journal cartridge has begun cleaning.
PTR_SUE_JRN_CARTDRIGE_OK	All journal cartridges are ready and contain media.
PTR_SUE_REC_CARTRIDGE_EMPTY	A receipt cartridge needs to be replaced. Cartridge is empty or not present.
PTR_SUE_REC_CARTRIDGE_NEAREMPTY	A receipt cartridge is near end.
PTR_SUE_REC_HEAD_CLEANING	A receipt cartridge has begun cleaning.
PTR_SUE_REC_CARTDRIGE_OK	All receipt cartridges are ready and contain media.
PTR_SUE_SLP_CARTRIDGE_EMPTY	A slip cartridge needs to be replaced. Cartridge is empty or not present.
PTR_SUE_SLP_CARTRIDGE_NEAREMPTY	A slip cartridge is near end.
PTR_SUE_SLP_HEAD_CLEANING	A slip cartridge has begun cleaning.
PTR_SUE_SLP_CARTDRIGE_OK	All slip cartridges are ready and contain media.

Power reporting *StatusUpdateEvent* values

See **StatusUpdateEvent** description on page 74.

Remarks Fired when a significant status change has occurred.

CHAPTER 18

Remote Order Display

Summary

General Information

The Remote Order Display Control's OLE Programmatic ID is "OPOS.RemoteOrderDisplay".

This device was added in OPOS Release 1.3.

Capabilities

The Remote Order Display Control has the following minimal set of capabilities:

- Supports color or monochrome text character displays.
- Supports 8 foreground colors (or gray scale on monochrome display) with the option of using the intensity attribute.
- Supports 8 background colors (or gray scale on monochrome display) with the option of using only a blinking attribute.
- The individual event types can be disabled such that the application only receives a subset of data events if requested.
- Supports video region buffering.
- Supports cursor functions.
- Supports clock functions.
- Supports resetting a video unit to power on state.

The Remote Order Display Control may also have the following additional capabilities:

- Supports multiple video displays each with possibly different video modes.
- Supports touch video input for a touch screen display unit.
- Supports video enunciator output with frequency and duration.
- Supports tactile feedback via an automatic tone when a video display unit is touched (for touch screen only).
- Supports downloading alternate character sets to one or many video units.
- Supports transaction mode display output to one or many video units.

The following capability is not addressed in this version of the OPOS specification:

- Support for graphical displays, where the video display is addressable by individual pixels or dots. The addition of this support is under investigation for future revisions.

Model

The general model of a remote order display:

- The remote order display device class is a subsystem of video units. The initial targeted environment is food service, to display order preparation and fulfillment information. Remote order displays are often used in conjunction with bump bars.

The subsystem can support up to 32 video units.

One Application on one PC or POS Terminal will typically manage and control the entire subsystem of video units. If Applications on the same or other PCs and POS Terminals will need to access the subsystem, then this Application must act as a subsystem server and expose interfaces to other Applications.

- All specific methods are broadcast methods. This means that the method can apply to one unit, a selection of units or all online units. The *Units* parameter is a **Long**, with each bit identifying an individual video unit. (One or more of the constants ROD_UID_1 through ROD_UID_32 are bitwise ORed to form the bitmask.) The service object will attempt to satisfy the method for all units specified by the *Units* parameter. If an error is received from one or more units, the **ErrorUnits** property is updated with the appropriate units in error. The **ErrorString** property is updated with a description of the error or errors received. The method will then return with the corresponding OPOS error. In the case where two or more units encounter different errors, the service object should determine the most severe OPOS error to return.
- The common methods **CheckHealth**, **ClearInput**, and **ClearOutput** are not broadcast methods and use the unit ID specified by the **CurrentUnitID** property. (One of the constants ROD_UID_1 through ROD_UID_32 are selected.) See the description of these common methods to understand how the current unit ID property is used.
- When the current unit ID property is set by the application, all the corresponding properties are updated to reflect the settings for that unit.

If the current unit ID property is set to a unit ID that is not online, the dependent properties will contain non-initialized values.

The **CurrentUnitID** uniquely represents a single video unit. The definitions range from ROD_UID_1 to ROD_UID_32. These definitions are also used to create the bitwise parameter, *Units*, used in the broadcast methods. See the Examples section below for usage.

- The rows and columns are numbered beginning with (0,0) at the top-left corner of the video display. The dimensions are defined by the height and width parameters. The region depicted below would have the parameters *Row = 1*, *Column = 2*, *Height = 3*, and *Width = 4*.

	0	1	2	3	4	5	6
0							
1							
2							
3							
4							

All position parameters are expressed in text characters.

- The VGA-like *Attribute* parameter, that is used in various methods, is a **Long**. Bits 7-0 define the text attribute and bits 31-8 are reserved and must be 0, otherwise an OPOS_E_ILLEGAL error will be returned. The following table defines bits 7-0:

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Blinking	Background Color			Intensity	Foreground Color		

If a foreground or background color is requested, but the service object does not support that color, it chooses the best fit from the colors supported.

The following constants may be used, with up to one constant selected from each category:

- ◆ Blinking: ROD_ATTR_BLINK
- ◆ Background Color: ROD_ATTR_BG_color, where *color* is replaced by BLACK, BLUE, GREEN, CYAN, RED, MAGENTA, BROWN, or GRAY
- ◆ Intensity: ROD_ATTR_INTENSITY
- ◆ Foreground Color: ROD_ATTR_FG_color, where *color* is replaced by BLACK, BLUE, GREEN, CYAN, RED, MAGENTA, BROWN, or GRAY

See the examples section below for usage.

Input – Touch Video

The Remote Order Display Control follows the general “Input Model” for event-driven input with some differences:

- When input is received by the Control, it enqueues a **DataEvent**.
- This device does not support the **AutoDisable** property, so the control will not automatically disable itself when a **DataEvent** is enqueued.
- An enqueued **DataEvent** is delivered to the application when the **DataEventEnabled** property is TRUE and other event delivery requirements are met. Just before delivering this event, the Control copies the data into properties, and disables further data events by setting the **DataEventEnabled** property to FALSE. This causes subsequent input data to be enqueued by the Control while the application processes the current input and associated properties. When the application has finished the current input and is ready for more data, it reenables events by setting **DataEventEnabled** to TRUE.
- An **ErrorEvent** (or events) are enqueued if the Control encounters an error while gathering or processing input, and is delivered to the application when the **DataEventEnabled** property is TRUE and other event delivery requirements are met.
- The **VideoDataCount** property may be read to obtain the number of video **DataEvents** for a specific unit ID enqueued by the Control. The **DataCount** property can be read to obtain the total number of data events enqueued by the Control.
- Input enqueued by the Control may be deleted by calling the **ClearInput** method. See **ClearInput** method description for more details.

Output – Video and Tone

The Remote Order Display Control follows the general “Output Model”, with some enhancements:

- The following methods are always performed synchronously: **ControlClock**, **ControlCursor**, **SelectCharacterSet**, **ResetVideo**, and **SetCursor**. These methods will fail if asynchronous output is outstanding. The following method is also always performed synchronously but without regard to outstanding asynchronous output: **FreeVideoRegion**.
- The following methods are performed either synchronously or asynchronously, depending on the value of the **AsyncMode** property: **ClearVideo**, **ClearVideoRegion**, **CopyVideoRegion**, **DisplayData**, **DrawBox**, **RestoreVideoRegion**, **SaveVideoRegion**, **TransactionDisplay**, **UpdateVideoRegionAttribute**, and **VideoSound**. When **AsyncMode** is **FALSE**, then these methods operate synchronously and return their completion status to the application.

When **AsyncMode** is **TRUE**, then these methods operate as follows:

- ◆ The Control buffers the request, sets the **OutputID** property to an identifier for this request, and returns as soon as possible. When the device completes the request successfully, then the Control updates the **EventUnits** property and fires an **OutputCompleteEvent**. A parameter of this event contains the output ID of the completed request.

Asynchronous display methods will not return an error status due to a display problem, such as communications failure. These errors will only be reported by an **ErrorEvent**. An error status is returned only if the display is not claimed and enabled, a parameter is invalid, or the request cannot be enqueued. The first two error cases are due to an application error, while the last is a serious system resource exception.

- ◆ If an error occurs while performing an asynchronous request, an **ErrorEvent** is enqueued and delivered. The **EventUnits** property is set to the unit or units in error. The **EventString** property is also set.

*Note: **ErrorEvent** updates **EventUnits** and **EventString**. If an error is reported by a synchronous broadcast method, then **ErrorUnits** and **ErrorString** are set instead.*

The event handler may call synchronous display methods (but not asynchronous methods), then can either retry the outstanding output or clear it.

- ◆ The Control guarantees that asynchronous output is performed on a first-in first-out basis.

- ◆ All unit output buffered by the Control may be deleted by setting the **CurrentUnitID** property and calling the **ClearOutput** method. **OutputCompleteEvents** will not be fired for cleared output. This method also stops any output that may be in progress (when possible).
- The Remote Order Display Control device may support transaction mode. A transaction is a sequence of display operations that are sent to a video unit as a single unit. Display operations which may be included in a transaction are **ClearVideo**, **ClearVideoRegion**, **CopyVideoRegion**, **DisplayData**, **DrawBox**, **RestoreVideoRegion**, **SaveVideoRegion**, and **UpdateVideoRegionAttribute**. During a transaction, the display operations are first validated. If valid, they are added to the transaction but not displayed yet. Once the application has added as many operations as required, then the transaction display method is called.

If the transaction is displayed synchronously, then the returned status indicates either that the entire transaction displayed successfully or that an error occurred during the display. If the transaction is displayed asynchronously, then the asynchronous display rules listed above are followed. If an error occurs and the Error Event handler causes a retry, the entire transaction is retried.

Examples

Set up an attribute variable and initializes it for various uses.

```
' Standard white foreground on black background
lAttribute = ROD_ATTR_BG_BLACK | ROD_ATTR_FG_GRAY
```

```
' Turn Blinking on
lAttribute = lAttribute | ROD_ATTR_BLINK
```

Draws a box with a solid border on unit ID 1 and unit ID 4. The box is located at the top left corner (0,0) with a height of 80 and a width of 25.

```
ROD.DrawBox( ROD_UID_1 | ROD_UID_4, 0, 0, 80, 25, lAttribute,
             ROD_BDR_SOLID )
```

Device Sharing

The remote order display is an exclusive-use device. Its device sharing rules are:

- The application must claim the device before enabling it.
- The application must claim and enable the device before accessing many remote order display specific properties.
- The application must claim and enable the device before calling methods that manipulate the device.
- When a **ClaimDevice** method is called again, settable device characteristics are restored to their condition at **ReleaseDevice**. Examples of restored characteristics are character set, video mode, and tone frequency. Region memory buffers, clock and cursor settings are considered state characteristics and are not restored.
- See the “Summary” table for precise usage prerequisites.

Properties

AsyncMode Property R/W

Syntax	BOOL AsyncMode;
Remarks	<p>If TRUE, then the ClearVideo, ClearVideoRegion, CopyVideoRegion, DisplayData, DrawBox, RestoreVideoRegion, SaveVideoRegion, TransactionDisplay, UpdateVideoRegionAttribute, and VideoSound methods will be performed asynchronously.</p> <p>If FALSE, they will be performed synchronously.</p> <p>This property is initialized to FALSE by the Open method.</p>
Return	When this property is set, the following value is placed in the ResultCode property:
Value	Meaning
OPOS_SUCCESS	The property was set successfully.

AutoToneDuration Property R/W

Syntax	LONG AutoToneDuration;
Remarks	<p>Sets the duration (in milliseconds) of the automatic tone for the video unit specified by the CurrentUnitID property.</p> <p>This property is initialized to the default value for each online video unit when the device is first enabled following the Open method.</p>
Return	When this property is set, one of the following values is placed in the ResultCode property:
Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An illegal value was specified. The ErrorString property is updated before return.
See Also	CurrentUnitID Property

AutoToneFrequency Property R/W

Syntax **LONG AutoToneFrequency;**

Remarks Sets the frequency (in Hertz) of the automatic tone for the video unit specified by the **CurrentUnitID** property.

This property is initialized to the default value for each online video unit when the device is first enabled following the **Open** method.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An illegal value was specified. The ErrorString property is updated before return.

See Also **CurrentUnitID** Property

CapSelectCharacterSet Property

Syntax **BOOL CapSelectCharacterSet;**

Remarks If TRUE, the video unit specified by the **CurrentUnitID** property may be loaded with an alternate, user supplied character set; otherwise it is FALSE.

This property is initialized for each video unit online when the device is first enabled following the **Open** method.

See Also **CurrentUnitID** Property

CapTone Property

Syntax	BOOL CapTone;
Remarks	<p>If TRUE, the video unit specified by the CurrentUnitID property supports an enunciator; otherwise it is FALSE</p> <p>This property is initialized for each video unit online when the device is first enabled following the Open method.</p>
See Also	CurrentUnitID Property

CapTouch Property

Syntax	BOOL CapTouch;
Remarks	<p>If TRUE, the video unit specified by the CurrentUnitID property supports the ROD_DE_TOUCH_UP, ROD_DE_TOUCH_DOWN, and ROD_DE_TOUCH_MOVE event types; otherwise it is FALSE.</p> <p>This property is initialized for each video unit online when the device is first enabled following the Open method.</p>
See Also	CurrentUnitID Property; DataEvent Event

CapTransaction Property

Syntax	BOOL CapTransaction;
Remarks	<p>If TRUE, then transactions are supported by each video unit; otherwise it is FALSE.</p> <p>This property is initialized by the Open method.</p>

CharacterSet Property**Updated in Release 1.5****Syntax** **LONG CharacterSet;**

Remarks Contains the character set for displaying characters for the video unit specified by the **CurrentUnitID** property. When **CapSelectCharacterSet** is TRUE, this property can be set with one of the character set numbers found in the **CharacterSetList** property.

This property is initialized to the default video character set used by each video unit online when the device is first enabled following the **Open** method.

This is updated during the **SelectCharacterSet** method.

The character set number is one of the following ranges or values:

Value	Meaning
Range 101 - 199	A device-specific character set that does not match a code page, nor the ASCII or Windows ANSI character sets.
Range 400 - 990	Code page; matches one of the standard values.
ROD_CS_UNICODE	The character set supports UNICODE. The value of this constant is 997.
ROD_CS_ASCII	The ASCII character set, supporting the ASCII characters between 20-hex and 7F-hex. The value of this constant is 998.
ROD_CS_WINDOWS	The Windows ANSI character set. The value of this constant is 999. This is exactly equivalent to the Windows code page 1252.
Range 1000 and higher	Windows code page; matches one of the standard values.

See Also **CurrentUnitID** Property; **CharacterSetList** Property; **CapSelectCharacterSet** Property, **SelectCharacterSet** Method

CharacterSetList Property

Syntax	BSTR CharacterSetList;
Remarks	<p>A string of character set numbers for the video unit specified by the CurrentUnitID property.</p> <p>If CapSelectCharacterSet is TRUE, this property is initialized for each video unit online when the device is first enabled following the Open method; otherwise, this property is initialized with the string "[Error]".</p> <p>The character set number string consists of an ASCII numeric set of numbers, separated by commas.</p> <p>For example, if the string is "101, 850, 999", the video unit supports a device-specific character set, code page 850, and the Windows ANSI character set.</p>
See Also	CurrentUnitID Property; CharacterSet Property; CapSelectCharacterSet Property, SelectCharacterSet Method

Clocks Property

Syntax	LONG Clocks;
Remarks	<p>Indicates the number of clocks the video unit, specified by the CurrentUnitID property, can support.</p> <p>This property is initialized for each online video unit when the device is first enabled following the Open method.</p>
See Also	CurrentUnitID Property

CurrentUnitID Property R/W

Syntax **LONG CurrentUnitID;**

Remarks Selects the current video unit ID. Up to 32 units are allowed on one remote order display device. The unit ID definitions range from ROD_UID_1 to ROD_UID_32.

The following properties and methods apply only to the selected video unit ID:

- Properties: **AutoToneDuration, AutoToneFrequency, CapSelectCharacterSet, CapTone, CapTouch, CharacterSet, CharacterSetList, Clocks, VideoDataCount, VideoMode, VideoModesList, VideoSaveBuffers.**

Setting **CurrentUnitID** will update these properties to the current values for the specified unit.

- Methods: **CheckHealth, ClearInput, ClearOutput.**

This property is initialized to ROD_UID_1 when the device is first enabled following the **Open** method.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An illegal unit id was specified. The ErrorString property is updated before return.

DataCount Property (Common)

Syntax	LONG DataCount;
Remarks	<p>Indicates the total number of DataEvents enqueued at the control. All units online are included in this value. The number of enqueued events for a specific unit ID is stored in the VideoDataCount property.</p> <p>The application may interrogate DataCount to determine whether additional input is enqueued from a device, but has not yet been delivered because of other application processing, freezing of events, or other causes.</p> <p>This property is initialized to zero by the Open method.</p>
See Also	“Input Model”; VideoDataCount Property; DataEvent Event

ErrorString Property

Syntax	BSTR ErrorString;
Remarks	<p>When an error occurs for any method that acts on a bitwise set of video units, the ErrorString is set to a description of the error which occurred to the unit(s) specified by the ErrorUnits property.</p> <p>If an error occurs during processing of an asynchronous request, the ErrorEvent updates the property EventString instead.</p> <p>This property is initialized to an empty string by the Open method.</p>
See Also	ErrorUnits Property

ErrorUnits Property

Syntax	LONG ErrorUnits;
Remarks	<p>When an error occurs for any method that acts on a bitwise set of video units, the ErrorUnits will contain a bitwise mask of the unit(s) that encountered an error.</p> <p>If an error occurs during processing of an asynchronous request, the ErrorEvent updates the property EventUnits instead.</p> <p>This property is initialized to zero by the Open method.</p>
See Also	ErrorString Property

EventString Property

Syntax	BSTR EventString;
Remarks	<p>When an ErrorEvent is delivered, this property is set to a description of the error which occurred to the unit(s) specified by the EventUnits property.</p> <p>This property is initialized to an empty string by the Open method.</p>
See Also	EventUnits Property; ErrorEvent

EventType Property R/W

Syntax **LONG EventType;**

Remarks A bitwise mask that is used to selectively indicate which event types are to be fired by the **DataEvent**, for all video units online. See the **DataEvent** description for event type definitions.

For example if the ROD_DE_TOUCH_MOVE event is not desired:

```
ROD.EventType = ROD_DE_TOUCH_UP | ROD_DE_TOUCH_DOWN
```

This property is initialized to all defined event types by the **Open** method.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An illegal event type value was specified. The ErrorString property is updated before return.

See Also **DataEvent** Event

EventUnitID Property

Syntax **LONG EventUnitID;**

Remarks Just before the Control delivers a **DataEvent** to the Application, it sets this property to the video unit ID causing the event. The unit ID definitions range from ROD_UID_1 to ROD_UID_32.

See Also **DataEvent**

EventUnits Property

Syntax	LONG EventUnits;
Remarks	<p>When an OutputCompleteEvent, output ErrorEvent, or StatusUpdateEvent is fired, the EventUnits property will contain a bitwise mask of the unit(s).</p> <p>This property is initialized to zero by the Open method.</p>
See Also	OutputCompleteEvent, ErrorEvent, StatusUpdateEvent

SystemClocks Property

Syntax	LONG SystemClocks;
Remarks	<p>Indicates the total number of clocks the remote order display device can support at one time.</p> <p>This property is initialized when the device is first enabled following the Open method.</p>
See Also	Clocks Property

SystemVideoSaveBuffers Property

Syntax	LONG SystemVideoSaveBuffers;
Remarks	<p>Indicates the total number of video save buffers the remote order display device can support at one time.</p> <p>This property is initialized when the device is first enabled following the Open method.</p>
See Also	VideoSaveBuffers Property

Timeout Property R/W

Syntax **LONG Timeout;**

Remarks Timeout value in milliseconds used by the remote order display device to complete all output methods supported. If the device cannot successfully complete an output method within the timeout value, then the method returns a failure status if **AsyncMode** is FALSE, or enqueues an **ErrorEvent** if **AsyncMode** is TRUE.

This property is initialized to a Service Object dependent default timeout following the **Open** method.

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An illegal timeout value was specified. The ErrorString property is updated before return.

See Also **AsyncMode** Property

UnitsOnline Property

Syntax **LONG UnitsOnline;**

Remarks Bitwise mask indicating the video units online, where zero or more of the unit constants ROD_UID_1 (bit 0 on) through ROD_UID_32 (bit 31 on) are bitwise ORed.

This property is initialized when the device is first enabled following the **Open** method. This property is updated as changes are detected, such as before a **StatusUpdateEvent** is fired and during the **CheckHealth** method.

See Also **CheckHealth** Method; **StatusUpdateEvent** Event

VideoDataCount Property

- Syntax** **LONG VideoDataCount;**
- Remarks** Indicates the number of **DataEvents** enqueued for the video unit specified by the **CurrentUnitID** property.
- The application may interrogate **VideoDataCount** to determine whether additional input is enqueued by a video unit, but has not yet been delivered because of other application processing, freezing of events, or other causes.
- This property is initialized to zero by the **Open** method.
- See Also** **CurrentUnitID** Property; **DataEvent** Event

VideoMode Property R/W

- Syntax** **LONG VideoMode;**
- Remarks** Indicates the video *ModeId* selected for the video unit specified by the **CurrentUnitID** property. The *ModeId* represents one of the selections in the **VideoModesList** property.
- This property is initialized to the Service Object dependent default video *ModeId* used by each video unit online when the device is first enabled following the **Open** method.
- Return** When this property is set, one of the following values is placed in the **ResultCode** property:
- | Value | Meaning |
|----------------|---|
| OPOS_SUCCESS | The property was set successfully. |
| OPOS_E_ILLEGAL | The desired video mode is not supported. The ErrorString property is updated before return. |
| OPOS_E_FAILURE | An error occurred while communicating with the video unit specified by the CurrentUnitID property. The ErrorString property is updated before return. |
- See Also** **CurrentUnitID** Property; **VideoModesList** Property

VideoModesList Property

Syntax	BSTR VideoModesList;
Remarks	<p>The video modes supported for the video unit specified by the CurrentUnitID property. The video modes are listed in a comma delineated string with the following format:</p> <p style="padding-left: 40px;"><i><ModeId>:<Height>x<Width>x<NumberOfColors><M C></i>.</p> <p>The <i>ModeId</i> values are determined by the remote order display system. M = Monochrome (and gray scales) and C = Color.</p> <p>For example, if the string is “1:40x25x16C,2:80x25x16C”, then the video unit supports two video modes, <i>ModeId</i> 1 and <i>ModeId</i> 2. <i>ModeId</i> 1 has 40 rows, 25 columns, 16 colors, and is Color. <i>ModeId</i> 2 has 80 rows, 25 columns, 16 colors, and is Color.</p> <p>The <i>ModeId</i> is used to initialize the VideoMode property for each video unit online.</p> <p>This property is initialized to the video modes list supported by each video unit online when the device is first enabled following the Open method.</p>
See Also	CurrentUnitID Property; VideoMode Property

VideoSaveBuffers Property

Syntax	LONG VideoSaveBuffers;
Remarks	<p>Indicates the number of save buffers for the video unit specified by the CurrentUnitID property. This property should be consulted when using the SaveVideoRegion, RestoreVideoRegion and FreeVideoRegion methods. When set to 0, this indicates that buffering for the selected unit is not supported. When VideoSaveBuffers is greater than 0, the remote order display device can save at minimum one entire video screen for the selected video unit.</p> <p>This property is initialized for each video unit online when the device is first enabled following the Open method.</p>
See Also	CurrentUnitID Property; SaveVideoRegion Method; RestoreVideoRegion Method; FreeVideoRegion Method

Methods

CheckHealth Method (Common)

Syntax **LONG CheckHealth (LONG Level);**

The *Level* parameter indicates the type of health check to be performed on the device. The following values may be specified:

Value	Meaning
OPOS_CH_INTERNAL	Perform a health check that does not physically change the device. The device is tested by internal tests to the extent possible.
OPOS_CH_EXTERNAL	Perform a more thorough test that may change the device. For example, a pattern may be displayed on the video.
OPOS_CH_INTERACTIVE	Perform an interactive test of the device. The Service Object will typically display a modal dialog box to present test options and results.

Remarks When OPOS_CH_INTERNAL or OPOS_CH_EXTERNAL level is requested, the method will check the health of the unit specified by the **CurrentUnitID** property. When the current unit ID property is set to a unit that is not currently online, the device will attempt to check the health of the video unit and report a communication error if necessary. The OPOS_CH_INTERACTIVE health check operation is up to the service object designer.

A text description of the results of this method is placed in the **CheckHealthText** property.

The **UnitsOnline** property will be updated with any changes before returning to the application.

The **CheckHealth** method is always synchronous.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	Indicates that the health check procedure was initiated properly, and when possible to determine, indicates that the device is healthy. However, the health of many devices can only be determined by a visual inspection of the test results.
OPOS_E_ILLEGAL	The specified health check level is not supported by the Service Object.
OPOS_E_FAILURE	An error occurred while communicating with the video unit specified by the CurrentUnitID property.
<i>Other Values</i>	See ResultCode .

See Also **CurrentUnitID** Property; **UnitsOnline** Property

ClearInput Method (Common)

Syntax **LONG ClearInput ();**

Remarks Called to clear the device input that has been buffered for the unit specified by the **CurrentUnitID** property.

Any data events that are enqueued – usually waiting for **DataEventEnabled** to be set to TRUE and **FreezeEvents** to be set to FALSE – are also cleared.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_CLAIMED	The device is claimed by another process.
OPOS_E_NOTCLAIMED	The device must be claimed before this method can be used.

See Also **CurrentUnitID** Property; “Input Model”

ClearOutput Method (Common)

Syntax **LONG ClearOutput ();**

Remarks Called to clear all outputs that have been buffered for the unit specified by the **CurrentUnitID** property, including video and tone outputs.

Any output complete and output error events that are enqueued – usually waiting for **DataEventEnabled** to be set to TRUE and **FreezeEvents** to be set to FALSE – are also cleared.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_CLAIMED	The device is claimed by another process.
OPOS_E_NOTCLAIMED	The device must be claimed before this method can be used.

See Also **CurrentUnitID** Property; “Output Model”

ClearVideo Method

Syntax **LONG ClearVideo (LONG Units, LONG Attribute);**

Parameter	Description
<i>Units</i>	Bitwise mask indicating which video unit(s) to operate on.
<i>Attribute</i>	See “Model” discussion in the General Information section.

Remarks This method will clear the entire display area for the video unit(s) specified by the *Units* parameter. The display area will be cleared using the attribute placed in the *Attribute* parameter.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> • <i>Attribute</i> is illegal. • <i>Units</i> is zero or a non-existent unit was specified.
OPOS_E_FAILURE	An error occurred while communicating with one of the video units specified by <i>Units</i> . The ErrorUnits and ErrorString properties are updated before return. (Can only be returned if AsyncMode is FALSE.)
<i>Other Values</i>	See ResultCode .

See Also **AsyncMode** Property; “Model” discussion

ClearVideoRegion Method

Syntax **LONG ClearVideoRegion (LONG Units, LONG Row, LONG Column, LONG Height, LONG Width, LONG Attribute);**

Parameter	Description
<i>Units</i>	Bitwise mask indicating which video unit(s) to operate on.
<i>Row</i>	The region’s start row.
<i>Column</i>	The region’s start column.
<i>Height</i>	The number of rows in the region.
<i>Width</i>	The number of columns in the region.
<i>Attribute</i>	See “Model” discussion in the General Information section.

Remarks This method will clear the specified video region for the video unit(s) specified by the *Units* parameter. The display area will be cleared using the attribute placed in the *Attribute* parameter.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none">• <i>Row</i>, <i>Column</i>, <i>Height</i>, or <i>Width</i> are out of range.• <i>Attribute</i> is illegal.• <i>Units</i> is zero or a non-existent unit was specified. The ErrorUnits and ErrorString properties may be updated before return.
OPOS_E_FAILURE	An error occurred while communicating with one of the video units specified by <i>Units</i> . The ErrorUnits and ErrorString properties are updated before return. (Can only be returned if AsyncMode is FALSE.)
<i>Other Values</i>	See ResultCode .

See Also **AsyncMode** Property; **ErrorString** Property; **ErrorUnits** Property; “Model” discussion

ControlClock Method

Syntax **LONG ControlClock (LONG Units, LONG Function, LONG ClockId, LONG Hour, LONG Min, LONG Sec, LONG Row, LONG Column, LONG Attribute, LONG Mode);**

Parameter	Description
<i>Units</i>	Bitwise mask indicating which video unit(s) to operate on.
<i>Function</i>	The requested clock command. See values below.
<i>ClockId</i>	Clock identification number. The valid values can be from 1 - Clocks . When the <i>Function</i> parameter is ROD_CLK_PAUSE, ROD_CLK_RESUME, or ROD_CLK_STOP then <i>ClockId</i> can be ROD_CLK_ALL to specify all clocks started on the specified video unit(s).
<i>Hour</i>	The initial hours for the clock display.
<i>Min</i>	The initial minutes for the clock display.
<i>Sec</i>	The initial seconds for the clock display.
<i>Row</i>	The clock's row.
<i>Column</i>	The clock's start column.
<i>Attribute</i>	See "Model" discussion in the General Information section.
<i>Mode</i>	The type of clock to display. See values below.

The *Function* parameter values are:

Value	Meaning
ROD_CLK_START	Starts a clock display assigned to the given <i>ClockId</i> .
ROD_CLK_PAUSE	Temporarily stops a clock from updating the display until a ROD_CLK_RESUME requested.
ROD_CLK_RESUME	Resumes a clock that was previously paused, such that display updates continue.
ROD_CLK_STOP	Permanently stops the clock from updating the display and the <i>ClockId</i> becomes free.
ROD_CLK_MOVE	Moves an instantiated clock to a new position.

The *Mode* parameter values are:

Value	Meaning
ROD_CLK_SHORT	Displays a clock with “M:SS” format.
ROD_CLK_NORMAL	Displays a clock with “MM:SS” format.
ROD_CLK_12_LONG	Displays a 12 hour clock with “HH:MM:SS” format.
ROD_CLK_24_LONG	Displays a 24 hour clock with “HH:MM:SS” format.

Remarks This method will carryout the clock command requested in the *Function* parameter on the video unit(s) specified by the *Units* parameter. The clock will be displayed in the requested *Mode* format at the location found in the *Row* and *Column* parameters.

The clock will start at the specified *Hour*, *Min*, and *Sec*, time values and will be updated every second until a ROD_CLK_PAUSE or ROD_CLK_STOP is requested for this *ClockId*.

When a ROD_CLK_PAUSE, ROD_CLK_RESUME, or ROD_CLK_STOP command is issued, the *Hour*, *Min*, *Sec*, *Left*, *Top*, *Attribute*, and *Mode* parameters are ignored. During a ROD_CLK_PAUSE command, the clock display updates are suspended. During a ROD_CLK_RESUME command, the clock updates continue.

If a ROD_CLK_PAUSE, ROD_CLK_RESUME, ROD_CLK_STOP or ROD_CLK_MOVE command is requested on an uninitialized *ClockId* for any of the video units specified by the *Units* parameter, an OPOS_EROD_BADCLK is returned. If a ROD_CLK_RESUME command is requested without doing a ROD_CLK_PAUSE, this has no effect and no error is returned.

When a ROD_CLK_MOVE command is issued, the clock is moved to the new location found in the *Row* and *Column* parameters. The *Hour*, *Min*, *Sec*, *Attribute* and *Mode* parameters are ignored for this command function.

Generally a video unit can support the number of clocks specified by the **Clocks** property. However, the ROD_CLK_START command will return OPOS_EROD_NOCLOCKS if it exceeds the number of **SystemClocks** even though the **Clocks** property may indicated the unit can support more clocks than allocated for that unit.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> • <i>ClockId</i>, <i>Hour</i>, <i>Min</i>, <i>Sec</i>, <i>Row</i>, or <i>Column</i> are out of range. • <i>Function</i>, <i>Attribute</i> or <i>Mode</i> is illegal. • <i>Units</i> is zero or a non-existent unit was specified. The ErrorUnits and ErrorString properties are updated before return.
OPOS_E_EXTENDED	<p>ResultCodeExtended = OPOS_EROD_BADCLK: A ROD_CLK_PAUSE, ROD_CLK_RESUME, ROD_CLK_START, ROD_CLK_MOVE command was requested and the specified <i>ClockId</i> has not been initialized by the ROD_CLK_START command.</p> <p>ResultCodeExtended = OPOS_EROD_NOCLOCKS: The ROD_CLK_START failed because the number of SystemClocks has been reached.</p> <p>The ErrorUnits and ErrorString properties are updated before return.</p>
OPOS_E_FAILURE	An error occurred while communicating with one of the video units specified by the <i>Units</i> parameter. The ErrorUnits and ErrorString properties are updated before return.
OPOS_E_BUSY	A ROD_CLK_START command was requested but the specified <i>ClockId</i> is in use. The ErrorUnits and ErrorString properties are updated before return.
<i>Other Values</i>	See ResultCode .

See Also **Clocks** Property; **ErrorString** Property; **ErrorUnits** Property; “Model” discussion

ControlCursor Method

Syntax **LONG ControlCursor (LONG *Units*, LONG *Function*);**

Parameter	Description
<i>Units</i>	Bitwise mask indicating which video unit(s) to operate on.
<i>Function</i>	The cursor command, indicating the type of cursor to display. See values below.
Value	Meaning
ROD_CRS_LINE	Enable a solid underscore line.
ROD_CRS_LINE_BLINK	Enable a blinking solid underscore cursor.
ROD_CRS_BLOCK	Enable a solid block cursor.
ROD_CRS_BLOCK_BLINK	Enable a blinking solid block cursor.
ROD_CRS_OFF	Disable cursor.

Remarks This method will enable or disable the cursor depending on the *Function* parameter, for the video unit(s) specified by the *Units* parameter.

When the *Function* is ROD_CRS_OFF, the cursor is disabled, otherwise the cursor is enabled as the requested cursor type. If the video unit cannot support the requested cursor type, the service object will use the next closest cursor type.

The cursor attribute is taken from the current cursor location.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> • <i>Function</i> is illegal. • <i>Units</i> is zero or a non-existent unit was specified.
OPOS_E_FAILURE	An error occurred communicating with one of the video units specified by <i>Units</i> . The ErrorUnits and ErrorString properties are updated before return.
<i>Other Values</i>	See ResultCode .

See Also **ErrorString** Property; **ErrorUnits** Property

CopyVideoRegion Method

Syntax **LONG CopyVideoRegion (LONG Units, LONG Row, LONG Column, LONG Height, LONG Width, LONG TargetRow, LONG TargetColumn);**

Parameter	Description
<i>Units</i>	Bitwise mask indicating which video unit(s) to operate on.
<i>Row</i>	The region's start row.
<i>Column</i>	The region's start column.
<i>Height</i>	The number of rows in the region.
<i>Width</i>	The number of columns in the region.
<i>TargetRow</i>	The start row of the target location.
<i>TargetColumn</i>	The start column of the target location.

Remarks This method will copy a region of the display area to a new location on the display area for the video unit(s) specified by the *Units* parameter. The source area is defined by the *Row*, *Column*, *Height*, and *Width* parameters. The top-left corner of the target location is defined by the *TargetRow* and *TargetColumn* parameters. If the ranges overlap the copy is done such that all original data is preserved.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none">• <i>Row</i>, <i>Column</i>, <i>Height</i>, <i>Width</i>, <i>TargetRow</i>, or <i>TargetColumn</i> are out of range.• <i>Units</i> is zero or a non-existent unit was specified. The ErrorUnits and ErrorString properties are updated before return.
OPOS_E_FAILURE	An error occurred while communicating with one of the video units specified by <i>Units</i> . The ErrorUnits and ErrorString properties are updated before return. (Can only be returned if AsyncMode is FALSE.)
<i>Other Values</i>	See ResultCode .

See Also **AsyncMode** Property; **ErrorString** Property; **ErrorUnits** Property; “Model” discussion

DisplayData Method

Syntax **LONG DisplayData (LONG *Units*, LONG *Row*, LONG *Column*, LONG *Attribute*, BSTR *Data*);**

Parameter	Description
<i>Units</i>	Bitwise mask indicating which video unit(s) to operate on.
<i>Row</i>	The start row for the text.
<i>Column</i>	The start column for the text.
<i>Attribute</i>	The video attribute. See “Model” discussion in the General Information section.
<i>Data</i>	The string of characters to display. The format of this data depends upon the value of the BinaryConversion property. See page 31.

Remarks The characters in *Data* are processed beginning at the location specified by *Row* and *Column*, and continue in succeeding columns on the video unit(s) specified by the *Units* parameter. Any characters that extend beyond the last column will be discarded.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none">• <i>Row</i> or <i>Column</i> parameters are out of range.• <i>Attribute</i> is illegal. <i>Units</i> is zero or a non-existent unit was specified. The ErrorUnits and ErrorString properties are updated before return.
OPOS_E_FAILURE	An error occurred while communicating with one of the video units specified by <i>Units</i> . The ErrorUnits and ErrorString properties are updated before return. (Can only be returned if AsyncMode is FALSE.)
<i>Other Values</i>	See ResultCode .

See Also **AsyncMode** Property; **ErrorString** Property; **ErrorUnits** Property; “Model” discussion

DrawBox Method

Syntax **LONG DrawBox (LONG Units, LONG Row, LONG Column, LONG Height, LONG Width, LONG Attribute, LONG BorderType);**

Parameter	Description
<i>Units</i>	Bitwise mask indicating which video unit(s) to operate on.
<i>Row</i>	The box's start row.
<i>Column</i>	The box's start column.
<i>Height</i>	The number of rows in the box.
<i>Width</i>	The number of columns in the box.
<i>Attribute</i>	The video attribute. See "Model" discussion in the General Information section.
<i>BorderType</i>	The border type to be drawn. Can be any printable character or a defined border type. See values below.

Value	Meaning
ROD_BDR_SINGLE	A single line border.
ROD_BDR_DOUBLE	A double line border.
ROD_BDR_SOLID	A solid block border.

Remarks This method will draw a box on the video units(s) specified by the *Units* parameter.

The remote order display will attempt to draw a box with the border type specified. If the character set does not support the chosen border type, the service object will choose the best fit from the given character set.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> • <i>Row</i>, <i>Column</i>, <i>Height</i>, or <i>Width</i> are out of range. • <i>Attribute</i> or <i>BorderType</i> are illegal. • <i>Units</i> is zero or a non-existent unit was specified. The ErrorUnits and ErrorString properties are updated before return.
OPOS_E_FAILURE	An error occurred while communicating with one of the displays specified by <i>Units</i> . The ErrorUnits and ErrorString properties are updated before return.
<i>Other Values</i>	See ResultCode .

See Also **AsyncMode** Property; **ErrorString** Property; **ErrorUnits** Property; “Model” discussion

FreeVideoRegion Method

Syntax **LONG FreeVideoRegion (LONG Units, LONG BufferId);**

Parameter	Description
<i>Units</i>	Bitwise mask indicating which video unit(s) to operate on.
<i>BufferId</i>	Number identifying the video buffer to free. Valid values range from 1 to the VideoSaveBuffers property for a selected unit(s).

Remarks This method will free any buffer memory allocated for the video unit(s) specified by the *Units* parameter. The number of video buffers supported is stored in the **VideoSaveBuffers** property for each video unit online. If the *BufferId* was never used in a previous **SaveVideoRegion** method, no action is taken and OPOS_SUCCESS is returned.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> • <i>BufferId</i> is out of range. • <i>Units</i> is zero or a non-existent unit was specified. The ErrorUnits and ErrorString properties are updated before return.
OPOS_E_FAILURE	An error occurred communicating with one of the video units specified by <i>Units</i> . The ErrorUnits and ErrorString properties are updated before return.
<i>Other Values</i>	See ResultCode .

See Also **ErrorString** Property; **ErrorUnits** Property; **VideoSaveBuffers** Property; **SaveVideoRegion** Method

ResetVideo Method

Syntax **LONG ResetVideo (LONG Units);**

Units is a bitwise mask indicating which video unit(s) to operate on.

Remarks Sets the video unit(s) specified by the *Units* parameter to a power on state. All internal service object buffers and clocks associated with the unit(s) are released. All settable characteristics are set to default values.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_FAILURE	An error occurred while communicating with one of the video units specified by <i>Units</i> . The ErrorUnits and ErrorString properties are updated before return.
<i>Other Values</i>	See ResultCode .

See Also **ErrorString** Property; **ErrorUnits** Property

RestoreVideoRegion Method

Syntax **LONG RestoreVideoRegion (LONG Units, LONG TargetRow, LONG TargetColumn, LONG BufferId);**

Parameter	Description
<i>Units</i>	Bitwise mask indicating which video unit(s) to operate on.
<i>TargetRow</i>	The start row of the target location.
<i>TargetColumn</i>	The start column of the target location.
<i>BufferId</i>	Number identifying the source video buffer to use. Valid values range from 1 to the VideoSaveBuffers property for the selected unit(s).

Remarks This method will restore a previously saved video region of the display area from the requested *BufferId* for the video unit(s) specified by the *Units* parameter. A region can be saved using the **SaveVideoRegion** method. The number of video buffers supported is stored in the **VideoSaveBuffers** property for each video unit online. The target location is defined by the *TargetRow* and *TargetColumn* parameters. This method does not free the memory after restoring, therefore, this method can be used to copy a video region to multiple locations on the display. Use the **FreeVideoRegion** method to free any memory allocated for a video buffer.

If the *BufferId* does not contain a previously saved video region for the *Units* selected, an OPOS_EROD_NOREGION error is returned.

Video regions cannot be restored between video units. For example, the **SaveVideoRegion** method is called with *Units* = 0000 1000 and *BufferId* = 1. This will save a video region for the Unit Id 4, in to Buffer 1 for that unit. If **RestoreVideoRegion** is called with *Units* = 0000 0100 and *BufferId* = 1 with the intention of restoring the previously saved buffer to Unit Id 3, the return status could either be OPOS_EROD_NOREGION or an unwanted region is restored.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none">• <i>BufferId</i>, <i>TargetRow</i>, or <i>TargetColumn</i> are out of range.• <i>Units</i> is zero or a non-existent unit was specified. The ErrorUnits and ErrorString properties are updated before return.
OPOS_E_EXTENDED	ResultCodeExtended = OPOS_EROD_NOREGION: The <i>BufferId</i> does not contain a previously saved video region.
OPOS_E_FAILURE	An error occurred while communicating with one of the video units specified by <i>Units</i> . The ErrorUnits and ErrorString properties are updated before return. (Can only be returned if AsyncMode is FALSE.)
<i>Other Values</i>	See ResultCode .

See Also **AsyncMode** Property; **ErrorString** Property; **ErrorUnits** Property; **VideoSaveBuffers** Property; **SaveVideoRegion** Method

SaveVideoRegion Method

Syntax **LONG SaveVideoRegion (LONG Units, LONG Row, LONG Column, LONG Height, LONG Width, LONG BufferId);**

Parameter	Description
<i>Units</i>	Bitwise mask indicating which video unit(s) to operate on.
<i>Row</i>	The start row of the region to save.
<i>Column</i>	The start column of the region to save.
<i>Height</i>	The number of rows in the region to save.
<i>Width</i>	The number of columns in the region to save.
<i>BufferId</i>	Number identifying the video buffer to use. Valid values range from 1 to the VideoSaveBuffers property for a selected unit(s).

Remarks This method will save the specified video region of the display area to one of the provided video buffers for the video unit(s) specified by the *Units* parameter. The number of video buffers supported is stored in the **VideoSaveBuffers** property for each video unit online. However, an OPOS_EROD_NOBUFFERS error will be returned if the requested buffer exceeds the number of **SystemVideoSaveBuffers** even though the **VideoSaveBuffers** property may indicated the unit can support more save buffers than currently allocated for that unit.

If **VideoSaveBuffers** is greater than 0, the service object will be able to support at minimum one entire video screen. This does not guarantee that the service object can save an entire video screen in each supported buffer for a single unit. An OPOS_EROD_NOROOM error is returned when all the buffer memory has been allocated for a specific unit.

The source area is defined by the *Row*, *Column*, *Height*, and *Width* parameters. The video region can be restored to the screen by calling the **RestoreVideoRegion** method. If **SaveVideoRegion** is called twice with the same *BufferId*, the previous video data is lost, and any allocated memory is returned to the system.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> • <i>BufferId</i>, <i>Row</i>, <i>Column</i>, <i>Height</i>, or <i>Width</i>, are out of range. • <i>Units</i> is zero or a non-existent unit was specified. The ErrorUnits and ErrorString properties are updated before return.
OPOS_E_EXTENDED	ResultCodeExtended = OPOS_EROD_NOBUFFERS: Requested buffer exceeds the number of SystemVideoSaveBuffers . ResultCodeExtended = OPOS_EROD_NOROOM: All the buffer memory has been allocated for a specific unit. The ErrorUnits and ErrorString properties are updated before return.
OPOS_E_FAILURE	An error occurred while communicating with one of the video units specified by <i>Units</i> . The ErrorUnits and ErrorString properties are updated before return. (Can only be returned if AsyncMode is FALSE.)
<i>Other Values</i>	See ResultCode .

See Also **AsyncMode** Property; **ErrorString** Property; **ErrorUnits** Property; **SystemVideoSaveBuffers** Property; **VideoSaveBuffers** Property; **RestoreVideoRegion** Method

SelectCharacterSet Method

Updated in Release 1.5

Syntax **LONG SelectCharacterSet (LONG Units, LONG CharacterSet);**

Parameter	Description
<i>Units</i>	Bitwise mask indicating which video unit(s) to operate on.
<i>CharacterSet</i>	Contains the character set for displaying characters. Values are:

Value	Meaning
Range 101-199	A device-specific character set that does not match a code page, nor the ASCII or Windows ANSI character sets.
Range 400-990	Code page; matches one of the standard values.
ROD_CS_UNICODE	The character set supports UNICODE. The value of this constant is 997.
ROD_CS_ASCII	The ASCII character set, supporting the ASCII characters between 20-hex and 7F-hex. The value of this constant is 998.
ROD_CS_WINDOWS	The Windows ANSI character set. The value of this constant is 999. This is exactly equivalent to the Windows code page 1252.
Ranges 1000 or higher	Windows code page; matches one of the standard values.

Remarks Selects a compatible character set for the video unit(s) specified by the *Units* parameter.

The **CharacterSet** property is updated for each video unit id for which a new character set is successfully.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none"> Value in <i>CharacterSet</i> is not supported or the unit(s) does not support the CapSelectCharacterSet capability. <i>Units</i> is zero or a non-existent unit was specified. The ErrorUnits and ErrorString properties are updated before return.
OPOS_E_FAILURE	An error occurred while communicating with one of the video units specified by <i>Units</i> . The ErrorUnits and ErrorString properties are updated before return.
<i>Other Values</i>	See ResultCode .

See Also **ErrorString** Property; **ErrorUnits** Property; **CapSelectCharacterSet** Property; **CharacterSet** Property

SetCursor Method

Syntax **LONG SetCursor (LONG Units, LONG Row, LONG Column);**

Parameter	Description
<i>Units</i>	Bitwise mask indicating which video unit(s) to operate on.
<i>Row</i>	Row to place the cursor on.
<i>Column</i>	Column to place the cursor on.

Remarks This method will update the cursor position on the video unit(s) specified by the *Units* parameter.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none">• <i>Row</i> or <i>Column</i> positions are out of range.• <i>Units</i> is zero or a non-existent unit was specified. The ErrorUnits and ErrorString properties are updated before return.
OPOS_E_FAILURE	An error occurred while communicating with one of the video units specified by <i>Units</i> . The ErrorUnits and ErrorString properties are updated before return.
<i>Other Values</i>	See ResultCode .

See Also **ErrorString** Property; **ErrorUnits** Property

TransactionDisplay Method

Syntax **LONG TransactionDisplay (LONG Units, LONG Function);**

Parameter	Description
<i>Units</i>	Bitwise mask indicating which video unit(s) to operate on.
<i>Function</i>	Transaction control function. Valid values are:
Value	Meaning
ROD_TD_TRANSACTION	Begin a transaction.
ROD_TD_NORMAL	End a transaction by displaying the buffered data.

Remarks Enters or exits transaction mode for the video unit(s) specified by the *Units* parameter.

If *Function* is ROD_TD_TRANSACTION, then transaction mode is entered. Subsequent calls to **ClearVideo**, **ClearVideoRegion**, **CopyVideoRegion**, **DisplayData**, **DrawBox**, **RestoreVideoRegion**, **SaveVideoRegion**, and **UpdateVideoRegionAttribute** will buffer the display data (either at the video unit or the Service Object, depending on the display capabilities) until **TransactionDisplay** is called with the *Function* parameter set to ROD_TD_NORMAL. (In this case, the display methods only validate the method parameters and buffer the data – they do not initiate displaying. Also, the value of the **AsyncMode** property does not affect their operation: No **OutputID** will be assigned to the request, nor will an **OutputCompleteEvent** be fired.)

If *Function* is ROD_TD_NORMAL, then transaction mode is exited. If some data was buffered by calls to the methods **ClearVideo**, **ClearVideoRegion**, **CopyVideoRegion**, **DisplayData**, **DrawBox**, **RestoreVideoRegion**, **SaveVideoRegion**, and **UpdateVideoRegionAttribute**, then the buffered data is displayed. The entire transaction is treated as one message. This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

Calling the **ClearOutput** method cancels transaction mode for the unit specified by the **CurrentUnitID** property. Any buffered print lines are also cleared.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none">• When CapTransaction is FALSE, this method may not be used.• <i>Function</i> parameter is illegal.• <i>Units</i> is zero or a non-existent unit was specified. The ErrorUnits and ErrorString properties are updated before return.
OPOS_E_BUSY	Cannot perform while output is in progress for one of the video units specified by <i>Units</i> . The ErrorUnits and ErrorString properties are updated before return. (Can only be returned if AsyncMode is FALSE and <i>Function</i> is ROD_TD_NORMAL)
OPOS_E_FAILURE	An error occurred communicating with one of the video units specified by <i>Units</i> . The ErrorUnits and ErrorString properties are updated before return. (Can only be returned if AsyncMode is FALSE and <i>Function</i> is ROD_TD_NORMAL)
<i>Other Values</i>	See ResultCode .

UpdateVideoRegionAttribute Method

Syntax **LONG UpdateVideoRegionAttribute (LONG Units, LONG Function, LONG Row, LONG Column, LONG Height, LONG Width, LONG Attribute);**

Parameter	Description
<i>Units</i>	Bitwise mask indicating which video unit(s) to operate on.
<i>Function</i>	The attribute command. See values below.
<i>Row</i>	The region's start row.
<i>Column</i>	The region's start column.
<i>Height</i>	The number of rows in the region.
<i>Width</i>	The number of columns in the region.
<i>Attribute</i>	See "Model" discussion in the General Information section.

The *Function* parameter values are:

Value	Meaning
ROD-UA-SET	Set the region with the new attribute.
ROD-UA-INTENSITY_ON	Turn on foreground intensity in the region.
ROD-UA-INTENSITY_OFF	Turn off foreground intensity in the region.
ROD-UA-REVERSE_ON	Reverse video the region.
ROD-UA-REVERSE_OFF	Remove reverse video from the region.
ROD-UA-BLINK_ON	Turn on blinking in the region.
ROD-UA-BLINK_OFF	Turn off blinking in the region.

Remarks This method will modify the attribute on the video unit(s) specified by the *Units* parameter in the region defined by the *Row*, *Column*, *Height*, and *Width* parameters. When the *Function* parameter is `ROD-UA-SET`, the region's attributes will be replaced with the new value in the *Attribute* parameter; otherwise the *Attribute* parameter is ignored and the region's attributes will be modified.

This method is performed synchronously if **AsyncMode** is `FALSE`, and asynchronously if **AsyncMode** is `TRUE`.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none">• <i>Row</i>, <i>Column</i>, <i>Height</i>, or <i>Width</i> positions are out of range.• <i>Attribute</i> or <i>Function</i> is illegal.• <i>Units</i> is zero or a non-existent unit was specified. The ErrorUnits and ErrorString properties are updated before return.
OPOS_E_FAILURE	An error occurred while communicating with one of the video units specified by <i>Units</i> . The ErrorUnits and ErrorString properties are updated before return. (Can only be returned if AsyncMode is <code>FALSE</code> .)
<i>Other Values</i>	See ResultCode .

See Also **AsyncMode** Property; **ErrorString** Property; **ErrorUnits** Property; "Model" discussion

VideoSound Method

Syntax **LONG VideoSound (LONG Units, LONG Frequency, LONG Duration, LONG NumberOfCycles, LONG InterSoundWait);**

Parameter	Description
<i>Units</i>	Bitwise mask indicating which video unit(s) to operate on.
<i>Frequency</i>	Tone frequency in Hertz.
<i>Duration</i>	Tone duration in milliseconds.
<i>NumberOfCycles</i>	If OPOS_FOREVER, then start tone sounding and, repeat continuously. Else perform the specified number of cycles.
<i>InterSoundWait</i>	When <i>NumberOfCycles</i> is not one, then pause for <i>InterSoundWait</i> milliseconds before repeating the tone cycle (before playing the tone again)

Remarks Sound the video enunciator for the video(s) specified by the *Units* parameter.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

The duration of a video tone cycle is:

Duration parameter +
InterSoundWait parameter (except on the last tone cycle)

After the video has started an asynchronous sound, then the **ClearOutput** method will stop the sound. (When an *InterSoundWait* value of OPOS_FOREVER was used to start the sound, then the application must use **ClearOutput** to stop the continuous sounding of tones.)

If the **CapTone** property is FALSE for the selected unit(s), an OPOS_E_ILLEGAL is returned.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none">• <i>NumberOfCycles</i> is neither a positive, non-zero value nor OPOS_FOREVER.• <i>NumberOfCycles</i> is OPOS_FOREVER when AsyncMode is FALSE.• A negative <i>InterSoundWait</i> was specified.• <i>Units</i> is zero or a non-existent unit was specified.• A unit in <i>Units</i> does not support the CapTone capability. The ErrorUnits and ErrorString properties may be updated before return.
OPOS_E_FAILURE	An error occurred while communicating with one of the video units specified by the <i>Units</i> parameter. The ErrorUnits and ErrorString properties are updated before return. (Can only be returned if AsyncMode is FALSE.)
<i>Other Values</i>	See ResultCode .

See Also **AsyncMode** Property; **ErrorString** Property; **ErrorUnits** Property; **CapTone** Property; **ClearOutput** Method

Events

DataEvent Event

Syntax **void DataEvent (LONG Status);**

The *Status* parameter is divided into four bytes. The diagram below indicates how the parameter *Status* is divided:

High Word		Low Word(Event Type)
High Byte	Low Byte	
Row	Column	ROD_DE_TOUCH_UP ROD_DE_TOUCH_DOWN ROD_DE_TOUCH_MOVE

Remarks Fired to indicate input data from a video touch unit to the application. The low word contains the Event Type. The high word contains additional data depending on the Event Type. When the Event Type is ROD_DE_TOUCH_UP, ROD_DE_TOUCH_DOWN, or ROD_DE_TOUCH_MOVE, the high word indicates where the touch occurred. The low byte contains the Column position and the high byte contains the Row position, with valid values ranging from 0-255.

Data events can be filtered at the remote order display device by setting the **EventType** property.

The **EventUnitID** property is updated before delivering the event.

See Also “Input Model”; **EventUnitID** Property; **DataEventEnabled** Property; **FreezeEvents** Property

OutputCompleteEvent Event

Syntax **void OutputCompleteEvent (LONG OutputID);**

The *OutputID* parameter indicates the ID number of the asynchronous output request that is complete.

Remarks Fired when a previously started asynchronous output request completes successfully.

The **EventUnits** property is updated before delivering the event.

See Also “Output Model”; **EventUnits** Property

StatusUpdateEvent Event

Syntax **void StatusUpdateEvent (LONG *Status*);**

The *Status* parameter reports a change in the power state of a video unit.

Remarks Fired when the remote order display device detects a power state change.

Deviation from the standard **StatusUpdateEvent** (see page 74):

- Before delivering the event, the **EventUnits** property is set to the units for which the new power state applies.
- When the remote order display device is enabled, then the Control will fire a **StatusUpdateEvent** to specify the bitmask of online units.
- While the remote order display device is enabled, a **StatusUpdateEvent** is fired when the power state of one or more units change. If more than one unit changes state at the same time, the Service Object may choose to either fire multiple events or to coalesce the information into a minimal number of events applying to **EventUnits**.

See Also **EventUnits** Property

ErrorEvent Event

Syntax **void ErrorEvent (LONG *ResultCode*, LONG *ResultCodeExtended*, LONG *ErrorLocus*, LONG* *pErrorResponse*);**

Parameter	Description
<i>ResultCode</i>	Result code causing the error event. See ResultCode for values.
<i>ResultCodeExtended</i>	Extended result code causing the error event. See ResultCodeExtended for values.
<i>ErrorLocus</i>	Location of the error. See values below.
<i>pErrorResponse</i>	Pointer to the error event response. See values below.

The *ErrorLocus* parameter may be one of the following:

Value	Meaning
OPOS_EL_OUTPUT	Error occurred while processing asynchronous output.
OPOS_EL_INPUT	Error occurred while gathering or processing event-driven input. No input data is available.
OPOS_EL_INPUT_DATA	Error occurred while gathering or processing event-driven input, and some previously buffered data is available.

The contents at the location pointed to by the *pErrorResponse* parameter are preset to a default value, based on the *ErrorLocus*. The application may change the value to one of the following:

Value	Meaning
OPOS_ER_RETRY	Use only when locus is OPOS_EL_OUTPUT. Retry the asynchronous output. The error state is exited. Default when locus is OPOS_EL_OUTPUT.
OPOS_ER_CLEAR	Clear the buffered input data. The error state is exited. Default when locus is OPOS_EL_INPUT.
OPOS_ER_CONTINUEINPUT	Use only when locus is OPOS_EL_INPUT_DATA. Acknowledges the error and directs the Control to continue processing. The Control remains in the error state, and will deliver additional DataEvents as directed by the DataEventEnabled property. When all input has been delivered and the DataEventEnabled property is again set to TRUE, then another ErrorEvent is delivered with locus OPOS_EL_INPUT. Default when locus is OPOS_EL_INPUT_DATA.

- Remarks** Fired when an error is detected while trying to read remote order display data.
- Input error events are not delivered until the **DataEventEnabled** property is TRUE, so that proper application sequencing occurs.
- The **EventUnits** and **EventString** properties are updated before return.
- See Also** “Status, Result Code, and State Model”; **DataEventEnabled** Property; **EventUnits** Property; **EventString** Property

CHAPTER 19

Scale

General Information

The Scale Control's OLE programmatic ID is "OPOS.Scale".

Capabilities

The scale has the following capability:

- Provides item weight to the application. The measure of weight may be in grams, kilograms, ounces, or pounds, depending upon the scale device.

The scale may have the following additional capabilities:

- Includes an integrated display with the current weight, or with the current weight plus Application-specified text.
- Performs price calculations (weight X unit price) and returns the sale price. (This feature is mostly used in Europe at this time.)
- Supports Application setting of tare weight.
- Supports Application zeroing of the scale.

Model

The general model of a scale is:

- A scale returns the weight of an item placed on its weighing surface.
- The primary scale method is **ReadWeight**. By default, it is performed synchronously. It returns after reading data from the scale; the weight is returned in the location pointed to by the method parameter *pWeightData*. If an error occurs or if the timeout elapses, the **ReadWeight** method returns with an error code.

- **OPOS Release 1.3 and later – Asynchronous Input**

If the property **AsyncMode** is TRUE when **ReadWeight** is called, then the method is performed asynchronously. It initiates event driven input and returns immediately. The timeout parameter specifies the maximum time the application wants to wait for a settled weight. Additional points are:

- ◆ If an error occurs while initiating event driven input (such as the device is offline), then an error code is returned by **ReadWeight**. Otherwise, **ReadWeight** returns a success status to the Application, and scale processing continues asynchronously ...
- ◆ If a settled weight is received, then a **DataEvent** is enqueued containing the weight data in the *Status* parameter.
- ◆ If a scale error occurs (including a timeout with no settled weight), then an **ErrorEvent** is enqueued with an error code. The Application event handler may retry the weighing process by setting the response parameter (pointed to by *pErrorResponse*) to OPOS_ER_RETRY.
- ◆ Only one asynchronous call to **ReadWeight** can be in progress at a time. Nesting of asynchronous scale operations is illegal.
- ◆ An asynchronous scale operation may be cancelled with the **ClearInput** method.

For price-calculating scales, the Application must set the property **UnitPrice** before calling **ReadWeight**. After a weight is read (and just before the **DataEvent** is delivered to the Application, for asynchronous mode), the Control sets the property **SalesPrice** to the calculated price of the item.

Device Sharing

The scale is an exclusive-use device, as follows:

- After opening the device, properties are readable.
- The application must claim the device before enabling it.
- The application must claim and enable the device before calling methods that manipulate the device.
- See the “Summary” table for precise usage prerequisites.

Properties

AsyncMode Property R/W *Added in Release 1.3*

Syntax	BOOL AsyncMode;				
Remarks	<p>If TRUE, then the ReadWeight method will be performed asynchronously. If FALSE, this method will be performed synchronously.</p> <p>This property is initialized to FALSE by the Open method.</p>				
Return	<p>When this property is set, the following value is placed in the ResultCode property:</p> <table><tr><th>Value</th><th>Meaning</th></tr><tr><td>OPOS_SUCCESS</td><td>The property was set successfully.</td></tr></table>	Value	Meaning	OPOS_SUCCESS	The property was set successfully.
Value	Meaning				
OPOS_SUCCESS	The property was set successfully.				
See Also	ReadWeight Method				

CapDisplay Property *Added in Release 1.2*

Syntax	BOOL CapDisplay;
Remarks	<p>Set to TRUE if the scale includes an integrated display that shows the current weight; otherwise it is FALSE, indicating that the application may need to show the current weight on another display.</p> <p>This property is initialized by the Open method.</p>

CapDisplayText Property *Added in Release 1.3*

Syntax **BOOL CapDisplayText;**

Remarks Set to TRUE if the scale includes an integrated display that shows the current weight and can also show a text that describes the item being weighed. Otherwise FALSE, indicating that extra text cannot be shown on the display.

If TRUE, then **CapDisplay** must also be TRUE.

This property is initialized by the **Open** method.

See Also **MaxDisplayTextChars** Property

CapPriceCalculating Property *Added in Release 1.3*

Syntax **BOOL CapPriceCalculating;**

Remarks Set to TRUE if the scale can calculate prices. Otherwise FALSE, indicating that the scale only returns a weight.

For price calculating scales the calculation unit is in the scale rather than in the data-receiving terminal. For price-calculating scales the **UnitPrice** property is to be set before calling the **ReadWeight** method

This property is initialized by the **Open** method.

See Also **ReadWeight** Method, **WeightUnit** Property, **UnitPrice** Property, **SalesPrice** Property

CapTareWeight Property *Added in Release 1.3*

Syntax **BOOL CapTareWeight;**

Remarks Set to TRUE if the scale includes setting a tare value. Otherwise FALSE, indicating that the scale does not support tare values.

This property is initialized by the **Open** method.

See Also **TareWeight** Property

CapZeroScale Property***Added in Release 1.3***

- Syntax** **BOOL CapZeroScale;**
- Remarks** Set to TRUE if the Application can set the scale weight to zero. Otherwise FALSE, indicating that the scale does not support programmatic zeroing.
- This property is initialized by the **Open** method.
- See Also** **ZeroScale** Method

MaxDisplayTextChars Property***Added in Release 1.3***

- Syntax** **LONG MaxDisplayTextChars;**
- Remarks** The number of characters that may be displayed on an integrated display for the text which describes an article.
- If the capability **CapDisplayText** is FALSE, then the device does not support text displaying and **MaxDisplayTextChars** is always zero.
- This property is initialized by the **Open** method.
- See Also** **CapDisplayText** Property

MaximumWeight Property

- Syntax** **LONG MaximumWeight;**
- Remarks** Holds the maximum weight measurement possible from the scale. The measurement unit is available via the **WeightUnit** property.
- MaximumWeight** has an assumed decimal place located after the “thousands” digit position. For example, an actual value of 12345 represents 12.345, and an actual value of 5 represents 0.005.
- This property is initialized by the **Open** method.
- See Also** **WeightUnit** Property

SalesPrice Property***Added in Release 1.3*****Syntax** **CURRENCY SalesPrice;**

Remarks The sales price read from the scale for price calculating scales. For price-calculating scales the scale calculates this value during the process of weighing by multiplying the **UnitPrice** property by the acquired weight.

This property is set by the control before the **ReadWeight** method returns (in synchronous use) or the **DataEvent** is delivered by the control (in asynchronous use).

If the capability **CapPriceCalculating** is FALSE then the device is not a price-calculating scale and **SalesPrice** is always zero.

This property is initialized when the device is first enabled following the **Open** method to zero. (In releases prior to 1.5, this description stated that initialization took place by the **Open** method. In Release 1.5, it was updated for consistency with other devices.)

See Also **ReadWeight** Method, **WeightUnit** Property, **CapPriceCalculating** Property, **UnitPrice** Property

TareWeight Property R/W *Added in Release 1.3***Syntax** **LONG TareWeight;**

Remarks Holds the tare weight of scale data. The weight in **TareWeight** property has an assumed fractional part of three digits. For example, an actual value of 12345 represents 12.345, and an actual value of 5 represents 0.005. The measured unit is specified in the **WeightUnit** property. If the capability **CapTareWeight** is FALSE then the device does not support setting of a tare value and **TareWeight** is always zero.

Tare weight is not included in the item weight returned by the **ReadWeight** method.

This property is initialized when the device is first enabled following the **Open** method to the scale's default tare weight (usually zero). (In releases prior to 1.5, this description stated that initialization took place by the **Open** method. In Release 1.5, it was updated for consistency with other devices.)

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	CapTareWeight is FALSE or an invalid tare value was specified.
<i>Other Values</i>	See ResultCode .

See Also **CapTareWeight** Property, **ReadWeight** Method, **WeightUnit** Property

UnitPrice Property R/W**Added in Release 1.3****Syntax** CURRENCY UnitPrice;

Remarks Holds the unit price of the article to be weighed. For price calculating scales this property is to be set before starting the process of weighing. The scale itself calculates during weighing the property **SalesPrice** by multiplying the **UnitPrice** with the *pWeightData* parameter of the **ReadWeight** method. So, this property contains only a factor.

If the capability **CapPriceCalculating** is FALSE then the scale is not a price-calculating scale. In this case, setting of a unit price is not supported and **UnitPrice** is always zero.

This property is initialized when the device is first enabled following the **Open** method to zero. (In releases prior to 1.5, this description stated that initialization took place by the **Open** method. In Release 1.5, it was updated for consistency with other devices.)

Return When this property is set, one of the following values is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	CapPriceCalculating is FALSE or an invalid price was specified.
<i>Other Values</i>	See ResultCode .

See Also **ReadWeight** Method, **WeightUnit** Property, **CapPriceCalculating** Property, **SalesPrice** Property

WeightUnit Property

Syntax **LONG WeightUnit;**
 LONG WeightUnits; (Synonym for **WeightUnit**.¹⁰)

Remarks Holds the unit of weight of scale data.

Valid units are:

Value	Meaning
SCAL_WU_GRAM	Unit is a gram.
SCAL_WU_KILOGRAM	Unit is a kilogram (= 1000 grams).
SCAL_WU_OUNCE	Unit is an ounce.
SCAL_WU_POUND	Unit is a pound (= 16 ounces).

This property is initialized to the scale's weight unit by the **Open** method.

¹⁰ A Scale Control Object must support the property **WeightUnit**. In addition, due to a documentation error in OPOS APG Releases 1.1 and earlier, it is recommended that the property **WeightUnits** also be supported, and that it refer to the same property.

Methods

DisplayText Method

Added in Release 1.3

Syntax **LONG DisplayText (BSTR Data);**

Parameter	Description
-----------	-------------

<i>Data</i>	The string of characters to display. The format of this data depends upon the value of the BinaryConversion property. See page 39.
-------------	--

Remarks Call this method to update the text shown on the integrated display. Calling this method with an empty string (“”) will clear the display.

If the capability **CapDisplayText** is FALSE, then the device does not support text displaying and **DisplayText** will fail.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
-------	---------

OPOS_SUCCESS	The method was successful.
--------------	----------------------------

OPOS_E_ILLEGAL	An invalid text was specified – the text contains more characters than allowed in MaxDisplayTextChars , or displaying text is not allowed.
----------------	---

<i>Other Values</i>	See ResultCode .
---------------------	-------------------------

See Also **CapDisplay** Property, **CapDisplayText** Property, **MaxDisplayTextChars** Property,

ReadWeight Method

Syntax **LONG ReadWeight (LONG* *pWeightData*, LONG *Timeout*);**

Parameter	Description
<i>pWeightData</i>	If AsyncMode is FALSE, points to where the weight is returned; else must be zero.
<i>Timeout</i>	The number of milliseconds to wait for a settled weight before failing the method. If zero, the method attempts to read the scale weight, then returns the appropriate status immediately. If OPOS_FOREVER (-1), the method waits as long as needed until a weight is successfully read or an error occurs.

Remarks Call to read a weight from the scale.

Release 1.0 – 1.2

The weighing process is performed synchronously and the method will return after finishing the weighing process. The weight is returned at *pWeightData*,

Release 1.3 and later

If **AsyncMode** is FALSE, then **ReadWeight** operates synchronously, as with earlier releases.

If **AsyncMode** is TRUE, the weighing process is performed asynchronously. The method will initiate a read, then return immediately. If the method returns a success status, the weighing process is started and a **DataEvent** containing the weight in its *Status* parameter indicates its completion.

The weight has an assumed decimal place located after the “thousands” digit position. For example, an actual value of 12345 represents 12.345, and an actual value of 5 represents 0.005.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	A valid weight was read and placed into the specified location.
OPOS_E_ILLEGAL	An invalid <i>Timeout</i> parameter was specified.

OPOS_E_TIMEOUT A stable non-zero weight was not available before *Timeout* milliseconds elapsed (can only be returned if **AsyncMode** is FALSE).

OPOS_E_EXTENDED **ResultCodeExtended** = OPOS_ESCAL_OVERWEIGHT: The weight was over **MaximumWeight** (can only be returned if **AsyncMode** is FALSE).

Other Values See **ResultCode**.

See Also **UnitPrice** Property, **WeightUnit** Property, **CapPriceCalculating** Property, **SalesPrice** Property, **TareWeight** Property

ZeroScale Method

Added in Release 1.3

Syntax **LONG ZeroScale ();**

Remarks Call to set the current scale weight to zero. It may be used for initial calibration, or to account for tare weight on the scale.

May be called only if the property **CapZeroScale** is TRUE.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The method was successful.
OPOS_E_ILLEGAL	Scale zeroing is not supported.

Other Values See **ResultCode**.

See Also **CapZeroScale** Property

Events

DataEvent Event

- Syntax** **void DataEvent (LONG Status);**
- The *Status* parameter contains the weight.
- Remarks** Fired to present input data from the device to the application after an asynchronous **ReadWeight** was initiated.
- If the scale is a price-calculating scale, the unit price is placed in the **UnitPrice** property and the calculated sales price is placed in the **SalesPrice** property before this event is delivered.

ErrorEvent Event

- Syntax** **void ErrorEvent (LONG ResultCode, LONG ResultCodeExtended, LONG ErrorLocus, LONG* pErrorResponse);**

Parameter	Description
<i>ResultCode</i>	Result code causing the error event. See ResultCode for values.
<i>ResultCodeExtended</i>	Extended result code causing the error event. See ResultCodeExtended for values.
<i>ErrorLocus</i>	Location of the error. See values below.
<i>pErrorResponse</i>	Pointer to the error event response. See values below.

The *ErrorLocus* parameter may be one of the following:

Value	Meaning
OPOS_EL_INPUT	Error occurred while gathering or processing event-driven input. No input data is available.
OPOS_EL_INPUT_DATA	Error occurred while gathering or processing event-driven input, and some previously buffered data is available.

The contents at the location pointed to by the *pErrorResponse* parameter are preset to a default value, based on the *ErrorLocus*. The application may change the value to one of the following:

Value	Meaning
OPOS_ER_RETRY	Retry the asynchronous input. The error state is exited..
OPOS_ER_CLEAR	Clear the buffered input data. The error state is exited. Default when locus is OPOS_EL_INPUT.
OPOS_ER_CONTINUEINPUT	Use only when locus is OPOS_EL_INPUT_DATA. Acknowledges the error and directs the Control to continue processing. The Control remains in the error state, and will deliver additional DataEvents as directed by the DataEventEnabled property. When all input has been delivered and the DataEventEnabled property is again set to TRUE, then another ErrorEvent is delivered with locus OPOS_EL_INPUT. Default when locus is OPOS_EL_INPUT_DATA.

Remarks Fired when an error is detected while trying to read scale data.

Input error events are not delivered until the **DataEventEnabled** property is TRUE, so that proper application sequencing occurs.

See Also “Status, Result Code, and State Model”

CHAPTER 20

Scanner (Bar Code Reader)

General Information

The Scanner Control's OLE programmatic ID is "OPOS.Scanner".

Capabilities

The Scanner Control has the following capability:

- Reads encoded data from a label.

Model

The Scanner Control follows the general "Input Model" for event-driven input:

- When input is received by the Control, it enqueues a **DataEvent**.
- If the **AutoDisable** property is TRUE, then the control automatically disables itself when a **DataEvent** is enqueued.
- An enqueued **DataEvent** can be delivered to the application when the **DataEventEnabled** property is TRUE. Just before delivering this event, the Control copies the data into properties, and disables further data events by setting the **DataEventEnabled** property to FALSE. This causes subsequent input data to be enqueued by the Control while the application processes the current input and associated properties. When the application has finished the current input and is ready for more data, it reenables events by setting **DataEventEnabled** to TRUE.
- An **ErrorEvent** (or events) are enqueued if the Control encounters an error while gathering or processing input, and is delivered to the application when the **DataEventEnabled** property is TRUE.
- The **DataCount** property may be read to obtain the number of **DataEvents** enqueued by the Control.
- All input enqueued by the Control may be deleted by calling the **ClearInput** method.

Scanned data is placed into the property **ScanData**. If the application sets the property **DecodeData** to TRUE, then the data is decoded into **ScanDataLabel** and **ScanDataType**.

Device Sharing

The scanner is an exclusive-use device, as follows:

- The application must claim the device before enabling it.
- The application must claim and enable the device before the device begins reading input.
- See the “Summary” table for precise usage prerequisites.

Properties

DecodeData Property R/W *Added in Release 1.2*

Syntax **BOOL DecodeData;**

Remarks If TRUE, then the Control will decode **ScanData** into the properties **ScanDataLabel** and **ScanDataType**.

This property is initialized to FALSE by the **Open** method.

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.

ScanData Property

Syntax **BSTR ScanData;**

Remarks The data read from the scanner.
The format of this data depends upon the value of the **BinaryConversion** property.
See page 39.

Scan data is, in general, in the format as delivered from the scanner. Message header and trailer information are removed, however, since they do not contain useful information for an application and are likely to be scanner-specific.

Common header information is a prefix character (such as an STX character).
Common trailer information is a terminator character (such as an ETX or CR character) and a block check character if one is generated by the scanner.

ScanData should include a symbology character if one is returned by the scanner (for example, an 'A' for UPC-A). **ScanData** should also include check digits if they are present in the label and returned by the scanner. (Note that both symbology characters and check digits may or may not be present, depending upon the scanner configuration. The Scanner Control will return them if present, but will not generate or calculate them if they are absent.)

Some merchandise may be marked with a supplemental barcode. This barcode is typically placed to the right of the main barcode, and consists of an additional two or five characters of information. If the scanner reads merchandise that contains both main and supplemental barcodes, the supplemental characters are appended to the main characters, and the result is delivered to the application as one label. (Note that a scanner may support configuration that enables or disables the reading of supplemental codes.)

Some merchandise may be marked with multiple labels, sometimes called multi-symbol labels or tiered labels. These barcodes are typically arranged vertically, and may be of the same or different symbology. If the scanner reads merchandise that contains multiple labels, each barcode is delivered to the application as a separate label. This is necessary due to the current lack of standardization of these barcode types. One is not able to determine all variations based upon the individual barcode data. Therefore, the application will need to determine when a multiple label barcode has been read based upon the data returned. (Note that a scanner may or may not support reading of multiple labels.)

This property is set by the Control just before delivering the **DataEvent**.

ScanDataLabel Property***Added in Release 1.2*****Syntax** **BSTR ScanDataLabel;**

Remarks The decoded bar code label.
 The format of this data depends upon the value of the **BinaryConversion** property.
 See page 39.

When the property **DecodeData** is FALSE, **ScanDataLabel** is set to the empty string ("").

When the property **DecodeData** is TRUE, the Control decodes **ScanData** into **ScanDataLabel** as follows:

- Scanner-generated symbology characters are removed, if present.
- If the label type contains a readable check digit (such as with UPC-A and EAN-13), then it must be present in **ScanDataLabel**. If the scanner does not return the check digit to the Service Object, then it is to be calculated and included.
- For variable length bar codes, the length identification is removed, if present.

For example, the EAN-13 barcode which appears printed as "5 018374 827715" on a label may be received from the scanner and placed into **ScanData** as the following:

Received from scanner	ScanData	Comment
5018374827715	5018374827715	Complete barcode only
501837482771<CR>	501837482771	Without check digit with carriage return
F5018374827715<CR>	F5018374827715	With scanner-dependent symbology character and carriage return
<STX>F5018374827715<ETX>	F5018374827715	With header, symbology character, and trailer

For each of these cases (and any other variations), **ScanDataLabel** must always be set to the string "5018374827715", and **ScanDataType** must be set to **SCAN_SDT_EAN13**.

This property is set by the Control just before delivering the **DataEvent**.

ScanDataType Property***Added in Release 1.2*****Syntax** **LONG ScanDataType ;****Remarks** The decoded bar code label type.

When the property **DecodeData** is FALSE, **ScanDataType** is set to SCAN_SDT_UNKNOWN.

When the property **DecodeData** is TRUE, the Control tries to determine the scan label type. The Scanner Control header file (OposScan.h) defines several symbologies with constant names beginning with SCAN_SDT.

The following label types are defined in this release:

Value	Label Type
<i>One Dimensional Symbologies</i>	
SCAN_SDT_UPCA	UPC-A
SCAN_SDT_UPCA_S	UPC-A with supplemental barcode
SCAN_SDT_UPCE	UPC-E
SCAN_SDT_UPCE_S	UPC-E with supplemental barcode
SCAN_SDT_UPCD1	UPC-D1
SCAN_SDT_UPCD2	UPC-D2
SCAN_SDT_UPCD3	UPC-D3
SCAN_SDT_UPCD4	UPC-D4
SCAN_SDT_UPCD5	UPC-D5
SCAN_SDT_EAN8	EAN 8 (= JAN 8)
SCAN_SDT_JAN8	JAN 8 (= EAN 8)
SCAN_SDT_EAN8_S	EAN 8 with supplemental barcode
SCAN_SDT_EAN13	EAN 13 (= JAN 13)
SCAN_SDT_JAN13	JAN 13 (= EAN 13)
SCAN_SDT_EAN13_S	EAN 13 with supplemental barcode
SCAN_SDT_EAN128	EAN-128
SCAN_SDT_TF	Standard (or discrete) 2 of 5

SCAN_SDT_ITF	Interleaved 2 of 5
SCAN_SDT_Codabar	Codabar
SCAN_SDT_Code39	Code 39
SCAN_SDT_Code93	Code 93
SCAN_SDT_Code128	Code 128
SCAN_SDT_OCRA	OCR “A”
SCAN_SDT_OCRB	OCR “B”

Two Dimensional Symbolologies

SCAN_SDT_PDF417	PDF 417
SCAN_SDT_MAXICODE	MAXICODE

Special Cases

SCAN_SDT_OTHER	If greater or equal to this type, then the Service Object has returned a non-OPOS defined symbology.
SCAN_SDT_UNKNOWN	The Service Object cannot determine the barcode symbology. ScanDataLabel may not be properly formatted for the actual barcode type.

This property is set by the Control just before delivering the **DataEvent**.

Events

DataEvent Event

- Syntax** **void DataEvent (LONG Status);**
- The *Status* parameter contains zero.
- Remarks** Fired to present input data from the device to the application. The scanner data is placed in the **ScanData**, **ScanDataLabel**, and **ScanDataType** properties before this event is delivered.

ErrorEvent Event

- Syntax** **void ErrorEvent (LONG ResultCode, LONG ResultCodeExtended, LONG ErrorLocus, LONG* pErrorResponse);**

Parameter	Description
<i>ResultCode</i>	Result code causing the error event. See ResultCode for values.
<i>ResultCodeExtended</i>	Extended result code causing the error event. See ResultCodeExtended for values.
<i>ErrorLocus</i>	Location of the error. See values below.
<i>pErrorResponse</i>	Pointer to the error event response. See values below.

The *ErrorLocus* parameter may be one of the following:

Value	Meaning
OPOS_EL_INPUT	Error occurred while gathering or processing event-driven input. No input data is available.
OPOS_EL_INPUT_DATA	Error occurred while gathering or processing event-driven input, and some previously buffered data is available.

The contents at the location pointed to by the *pErrorResponse* parameter are preset to a default value, based on the *ErrorLocus*. The application may change the value to one of the following:

Value	Meaning
OPOS_ER_CLEAR	Clear the buffered input data. The error state is exited. Default when locus is OPOS_EL_INPUT.
OPOS_ER_CONTINUEINPUT	Use only when locus is OPOS_EL_INPUT_DATA. Acknowledges the error and directs the Control to continue processing. The Control remains in the error state, and will deliver additional DataEvents as directed by the DataEventEnabled property. When all input has been delivered and the DataEventEnabled property is again set to TRUE, then another ErrorEvent is delivered with locus OPOS_EL_INPUT. Default when locus is OPOS_EL_INPUT_DATA.

- Remarks** Fired when an error is detected while trying to read scanner data.
- Input error events are not delivered until the **DataEventEnabled** property is TRUE, so that proper application sequencing occurs.
- See Also** “Status, Result Code, and State Model”

CHAPTER 21

Signature Capture

General Information

The Signature Capture Control's OLE programmatic ID is "OPOS.SigCap".

Capabilities

The Signature Capture Control has the following capability:

- Obtains a signature captured by a signature capture device. The captured signature data is in the form of lines consisting of a series of points. Each point lies within the coordinate system defined by the resolution of the device, where (0, 0) is the upper-left point of the device, and (**MaximumX**, **MaximumY**) is the lower-right point. The signature line points are presented to the application by a **DataEvent** with a single array of line points

The Signature Capture Control may have the following additional capabilities:

- Provides a way for the user to terminate signature capture – that is, to tell the device that she or he has completed the signature.
- Displays form/data on the signature capture device.
- Returns the signature in “real time” as it is entered on the device. If this capability is true and has been enabled by application by setting the **RealTimeDataEnabled** property to TRUE, then a series of **DataEvents** are generated, each with an array of one or more line points representing a partial signature.

Model

The signature capture device usage model is:

- Open and claim the device.
- Enable the device and set **DataEventEnabled** to TRUE.
- Begin capturing a signature by calling the **BeginCapture** method. This method displays a form or data screen (if the device has a display) and enables the stylus.
- If the device is capable of supplying signature data in real time as the signature is entered (**CapRealTimeData** is set to TRUE), and if the **RealTimeDataEnabled** property is set to TRUE, the signature is presented to the application as a series of partial signature data events until the signature capture is terminated.
- If the device provides a way for the user to terminate the signature, then when the user terminates, the Control fires a **DataEvent**. Otherwise, the application must call the **EndCapture** method to terminate the signature.
- Disable the device. If the device has a display, this also clears the display.

The Signature Capture Control follows the general “Input Model” for event-driven input:

- When input is received by the Control, it enqueues a **DataEvent**.
- If the **AutoDisable** property is TRUE, then the control automatically disables itself when a **DataEvent** is enqueued. However, note that setting **AutoDisable** probably is not very useful for the Signature Capture control. If **RealTimeDataEnabled** is TRUE, then **AutoDisable** does not make sense. If **RealTimeDataEnabled** is FALSE, then the pacing of signatures is controlled by the application via the **BeginCapture** method. It is probably in the best interest of the application not to use the **AutoDisable** property for this device class.
- An enqueued **DataEvent** can be delivered to the application when the **DataEventEnabled** property is TRUE. Just before delivering this event, the Control copies the data into properties, and disables further data events by setting the **DataEventEnabled** property to FALSE. This causes subsequent input data to be enqueued by the Control while the application processes the current input and associated properties. When the application has finished the current input and is ready for more data, it reenables events by setting **DataEventEnabled** to TRUE.
- An **ErrorEvent** (or events) are enqueued if the Control encounters an error while gathering or processing input, and is delivered to the application when the **DataEventEnabled** property is TRUE.
- The **DataCount** property may be read to obtain the number of **DataEvents** enqueued by the Control.
- All input enqueued by the Control may be deleted by calling the **ClearInput** method.

Deviations from the Input Model are:

- The capture of signature data begins when the **BeginCapture** method is called.
- If signature capture is terminated by calling **EndCapture**, then no **DataEvent** is fired.

Device Sharing

The signature capture device is an exclusive-use device, as follows:

- The application must claim the device before enabling it.
- The application must claim and enable the device before calling methods that manipulate the device or before changing some writable properties.
- See the “Summary” table for precise usage prerequisites.

Properties

CapDisplay Property

Syntax	BOOL CapDisplay;
Remarks	Set to TRUE if the device is able to display a form or data entry screen; otherwise it is FALSE. This property is initialized by the Open method.

CapRealTimeData Property *Added in Release 1.2*

Syntax	BOOL CapRealTimeData;
Remarks	Set to TRUE if the device is able to supply signature data as the signature is being captured (“real time”); otherwise it is FALSE. This property is initialized by the Open method.

CapUserTerminated Property

Syntax	BOOL CapUserTerminated;
Remarks	Set to TRUE if the user is able to terminate signature capture by checking a completion box, pressing a completion button, or performing some other interaction with the device. Contains FALSE if the application must end signature capture by calling the EndCapture method. This property is initialized by the Open method.

DeviceEnabled Property R/W (Common)

Syntax **BOOL DeviceEnabled;**

Remarks Set to TRUE to enable the signature capture device.

Set to FALSE to disable the device. If **CapDisplay** is TRUE, then the display screen of the device is cleared.

This property is initialized to FALSE by the **Open** method.

MaximumX Property

Syntax **LONG MaximumX;**

Remarks Contains the maximum horizontal coordinate of the signature capture device. It must be less than 65,536.

This property is initialized by the **Open** method.

MaximumY Property

Syntax **LONG MaximumY;**

Remarks Contains the maximum vertical coordinate of the signature capture device. It must be less than 65,536.

This property is initialized by the **Open** method.

PointArray Property

Syntax **BSTR PointArray;**

Remarks Contains the signature captured from the device. It consists of an array of (x, y) coordinate points with the number of array entries specified in **TotalPoints**. Each point is represented by four characters: x (low 8 bits), x (high 8 bits), y (low 8 bits), y (high 8 bits).

The format of this data depends upon the value of the **BinaryConversion** property. See page 39.

A special point value is (0xFFFF, 0xFFFF) which indicates the end of a line (that is, a pen lift). Almost all signatures are comprised of more than one line.

If the **RealTimeDataEnabled** property is FALSE, then **PointArray** contains the entire captured signature.

If the **RealTimeDataEnabled** property is TRUE, then **PointArray** contains at least one point of the signature. The actual number of points delivered at one time is implementation dependent. The points from multiple data events are logically concatenated to form the entire signature, such that the last point from a data event is followed immediately by the first point of the next data event.

The point representation definition is the same regardless of whether the signature is presented as a single **PointArray**, or as a series of real time **PointArrays**.

Reconstruction of the signature using the points is accomplished by beginning a line from the first point in the signature to the second point, then to the third, and so on. When an end-of-line point is encountered, the drawing of the line ends, and the next line is drawn beginning with the next point. An end-of-line point is assumed (but need not be present in **PointArray**) at the end of the signature.

This property is set by the Control just before delivering the **DataEvent** or by the **EndCapture** method.

See Also **RawData** Property

RawData Property

Syntax	BSTR RawData;
Remarks	<p>Contains the signature captured from the device in a device-specific format. The format of this data depends upon the value of the BinaryConversion property. See page 39.</p> <p>This data is often in a compressed form to minimize signature storage requirements. Reconstruction of the signature from this data requires device-specific processing.</p> <p>This property is set by the Control just before delivering the DataEvent or by the EndCapture method.</p>
See Also	TotalPoints Property; PointArray Property

RealTimeDataEnabled Property R/W *Added in Release 1.2*

Syntax	BOOL RealTimeDataEnabled;						
Remarks	<p>When CapRealTimeData is TRUE and this property is set to TRUE, a series of partial signature data events is fired as the signature is captured until signature capture is terminated.</p> <p>Else, the captured signature is fired as a single data event when signature capture is terminated.</p> <p>Setting RealTimeDataEnabled will not cause any change in system behavior until a subsequent BeginCapture is performed. This prevents confusion regarding what would happen if it were modified between a BeginCapture - EndCapture pairing.</p> <p>This property is initialized to FALSE by the Open method.</p>						
Return	<p>When this property is set, one of the following values is placed in the ResultCode property:</p> <table><tr><th>Value</th><th>Meaning</th></tr><tr><td>OPOS_SUCCESS</td><td>The property was set successfully.</td></tr><tr><td>OPOS_E_ILLEGAL</td><td>Cannot set to TRUE because CapRealTimeData is FALSE.</td></tr></table>	Value	Meaning	OPOS_SUCCESS	The property was set successfully.	OPOS_E_ILLEGAL	Cannot set to TRUE because CapRealTimeData is FALSE.
Value	Meaning						
OPOS_SUCCESS	The property was set successfully.						
OPOS_E_ILLEGAL	Cannot set to TRUE because CapRealTimeData is FALSE.						
See Also	“General OLE for Retail POS Control Model”						

TotalPoints Property

Syntax **LONG TotalPoints;**

Remarks Contains the number of signature points in **PointArray**.

If **RealTimeDataEnabled** is TRUE, then **TotalPoints** is set to zero to indicate that all of the partial signatures have been provided to the application by the Control.

This property is set by the Control just before delivering the **DataEvent** or by the **EndCapture** method. It includes the line drawing terminators (see **PointArray**).

Methods

BeginCapture Method

Syntax **LONG BeginCapture (BSTR *FormName*);**

The *FormName* parameter contains the registry subkey name for obtaining form or data screen information for display on the device screen.

Remarks Call to start capturing a signature.

If **CapDisplay** is TRUE, then *FormName* is used to find information about the form or data screen to be displayed. The operating system registry key

`\HKEY_LOCAL_MACHINE\SOFTWARE\OLEforRetail\ServiceOPOS\
SignatureCapture\DeviceName\FormName`

is accessed to get this information. *DeviceName* is the Service Object's Device Name key.

The format and features of each signature capture device's form/data screen varies widely and is often built with proprietary tools. Therefore, this key's data and additional values and data under this key contain information that varies by Service Object. Typically, the registry key's data is set to a form/data screen file name, and extra registry values and data are set as needed to control its display. (See the appendix "APPENDIX B OPOS Registry Usage", page 869.)

After displaying the form or data screen, when applicable, the signature capture stylus is enabled.

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	Signature capture successfully started.
OPOS_E_NOEXIST	<i>FormName</i> was not found.
<i>Other Values</i>	See ResultCode .

EndCapture Method

Syntax **LONG EndCapture ();**

Remarks Call to stop capturing a signature.

Terminates signature capture.

If the **RealTimeDataEnabled** property is FALSE:

If a signature was captured, then it is placed in the properties **TotalPoints**, **PointArray**, and **RawData**. If no signature was captured, then **TotalPoints** is set to zero, and **PointArray** and **RawData** are set to the empty string ("").

If the **RealTimeDataEnabled** property is TRUE:

If there are signature points remaining which have not been delivered to the application by a **DataEvent**, then the remaining signature is placed into the properties **TotalPoints**, **PointArray**, and **RawData**. If no signature was captured or all signature points have been delivered to the application, then **TotalPoints** is set to zero, and **PointArray** and **RawData** are set to the empty string ("").

Return One of the following values is returned by the method and placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	Signature capture successfully stopped.
OPOS_E_ILLEGAL	Signature capture was not in progress.
<i>Other Values</i>	See ResultCode .

See Also **DataEvent**

Events

DataEvent Event

Syntax **void DataEvent (LONG *Status*);**

Remarks Fired to signal input data from the device to the application.

This event can only be fired if a.) **CapUserTerminated** is TRUE, or b.) **RealTimeDataEnabled** is TRUE.

The *Status* parameter contains TRUE if the user has entered a signature before terminating capture. It contains FALSE if the user terminated capture with no signature.

Before firing the event, the properties **TotalPoints**, **PointArray**, and **RawData** are set to appropriate values.

See Also **EndCapture** Method

ErrorEvent Event

Syntax **void ErrorEvent (LONG *ResultCode*, LONG *ResultCodeExtended*, LONG *ErrorLocus*, LONG* *pErrorResponse*);**

Parameter	Description
<i>ResultCode</i>	Result code causing the error event. See ResultCode for values.
<i>ResultCodeExtended</i>	Extended result code causing the error event. See ResultCodeExtended for values.
<i>ErrorLocus</i>	Location of the error. See values below.
<i>pErrorResponse</i>	Pointer to the error event response. See values below.

The *ErrorLocus* parameter may be one of the following:

Value	Meaning
OPOS_EL_INPUT	Error occurred while gathering or processing event-driven input. No input data is available.
OPOS_EL_INPUT_DATA	Error occurred while gathering or processing event-driven input, and some previously buffered data is available. (Very unlikely – see Remarks .)

The contents at the location pointed to by the *pErrorResponse* parameter are preset to a default value, based on the *ErrorLocus*. The application may change the value to one of the following:

Value	Meaning
OPOS_ER_CLEAR	Clear the buffered input data. The error state is exited. Default when locus is OPOS_EL_INPUT.
OPOS_ER_CONTINUEINPUT	Use only when locus is OPOS_EL_INPUT_DATA. Acknowledges the error and directs the Control to continue processing. The Control remains in the error state, and will deliver additional DataEvents as directed by the DataEventEnabled property. When all input has been delivered and the DataEventEnabled property is again set to TRUE, then another ErrorEvent is delivered with locus OPOS_EL_INPUT. Default when locus is OPOS_EL_INPUT_DATA.

Remarks Fired when an error is detected while trying to read signature capture data.

Input error events are not delivered until the **DataEventEnabled** property is TRUE, so that proper application sequencing occurs.

General Information

The Tone Indicator Control's OLE programmatic ID is "OPOS.ToneIndicator".

Capabilities

The Tone Indicator Control has the following capabilities:

- Sound a tone device, which may be the PC system speaker or another hardware device. In many cases the PC speaker will not be available or will be in a position that is inaudible to the operator.
- Sound a two-tone indicator, providing simple pitch and volume control.
- Provide a synchronous one-shot (play once while waiting) indicator, similar to the Win32 Beep function.

Model

The Tone Indicator device is for use when the POS hardware platform provides such capabilities external to the PC standard speaker. Many POS systems have such devices, for example the ICL 92R keyboard, so that an indicator is always present at the point of sale.

This device supports a two-tone sound so that "*siren*" tones can be produced. The indicator is in general also started asynchronously so applications may perform other functions while waiting for the user to acknowledge the tone. There are also options to start the tone asynchronously with no count, so it runs forever, and be stopped when running.

When the indicator is started asynchronously then an **OutputCompleteEvent** is fired when all the tones have been played. This allows the application to know that the tone has stopped. For example when the cash drawer is opened the tone could be started, quietly for a given number of cycles. If the cash drawer is closed then the tone is stopped explicitly by the application, if not then the **OutputCompleteEvent** allows us to alter the prompt to the operator and possibly restart the tone a little louder.

The Tone Indicator follows the general output model. Asynchronous output is handled as follows:

- The Control buffers the request, sets the **OutputID** property to an identifier for this request, and returns as soon as possible. When the device completes the request successfully, then the Control fires an **OutputCompleteEvent**. A parameter of this event contains the **OutputID** of the completed request.

The **Sound** method will not return an error status due to a hardware problem. These errors will only be reported by an **ErrorEvent**. An error status is returned only if the Control is claimed by another application, is not enabled, a parameter is invalid, or the request cannot be enqueued. The first three error cases are due to an application error, while the last is a serious system resource exception.

- If an error occurs while performing an asynchronous request, an **ErrorEvent** is fired.
- The Control guarantees that asynchronous output is performed on a first-in first-out basis.
- All output buffered by OPOS may be deleted by calling the **ClearOutput** method. **OutputCompleteEvents** will not be fired for cleared output. This method also stops any output that may be in progress (when possible).

Examples

Set up an asynchronous two-tone indicator and sounds it 100 times. Each tone is sounded for 750 milliseconds at 50% volume, with no pause between each tone.

```
Indicator.Tone1Pitch = 500
Indicator.Tone1Volume = 50
Indicator.Tone1Duration = 750
Indicator.Tone2Pitch = 800
Indicator.Tone2Volume = 50
Indicator.Tone2Duration = 750
Indicator.InterToneWait = 0
```

```
Indicator.AsyncMode = True
Indicator.Sound 100, 0
```

Start a synchronous indicator. This has a simple alternating beep, 500 milliseconds on and 500 milliseconds off.

```
Indicator.Tone1Pitch = 500
Indicator.Tone1Volume = 50
Indicator.Tone1Duration = 500
Indicator.Tone2Pitch = 0           ' turn off second tone
Indicator.InterToneWait = 0       ' no wait after tone-1
```

```
Indicator.AsyncMode = False
Indicator.Sound 100, 500
```

The following example will cause an error, as it defines both tones to be zero.

```
Indicator.Tone1Pitch = 0      ' turn off first tone
Indicator.Tone2Pitch = 0      ' turn off second tone

Indicator.Sound 100, 0
```

The indicator **Sound** method can also be used to start an indefinite duration tone. If the *NumberOfCycles* parameter is specified to be OPOS_FOREVER then the tone is started and must be stopped explicitly.

```
Indicator.Tone1Pitch = 500
Indicator.Tone1Volume = 50
Indicator.Tone1Duration = 500
Indicator.Tone2Pitch = 0      ' turn off second tone
Indicator.InterToneWait = 0    ' no wait after tone-1

Indicator.AsyncMode = True
Indicator.Sound OPOS_FOREVER, 500
```

To stop an outstanding tone you have to use the **ClearOutput** or **SoundImmediate** method.

```
...
Indicator.AsyncMode = True
Indicator.Sound OPOS_FOREVER, 500
...
Indicator.ClearOutput
    or
Indicator.SoundImmediate
```

There is also a **SoundImmediate** method which causes both tones to be sounded once with their **InterToneWait**. The tones are sounded synchronously. This imitates a more normal **Beep** function such as that provided by the Win32 API.

```
Indicator.Tone1Pitch = 500
Indicator.Tone1Volume = 50
Indicator.Tone1Duration = 500
Indicator.Tone2Pitch = 0      ' turn off second tone
Indicator.InterToneWait = 0    ' no wait after tone-1

Indicator.AsyncMode = True
Indicator.Sound 1, 0           ' asynchronous beep
Indicator.SoundImmediate       ' synchronous beep
```

Device Sharing

The Tone Indicator is a sharable device. Its device sharing rules are:

- After opening and enabling the device, the application may access all properties and methods and will receive status update events.
- If more than one application has opened and enabled the device, all applications may access its properties and methods. Status update events are fired to all of the applications.
- If one application claims the tone indicator, then only that application may call the **Sound** and **SoundImmediate** methods. Use of this feature will effectively restrict the tone indicator to the main POS application if that application claims the device at startup.
- The application that initiates asynchronous sounds is the only one that receives the corresponding **OutputCompleteEvents** or **ErrorEvents**.
- If a scenario exists such that an application is playing a sound and a separate application legally claims the device and plays a sound then the sound being played from the first application will be interrupted. If the first application is in the midst of a synchronous **Sound** method, it will return **OPOS_E_CLAIMED** from the method call. If the application has issued an asynchronous **Sound** method then no consistent reporting mechanism is possible and the first sound is simply terminated.
- See the “Summary” table for precise usage prerequisites.

Properties

AsyncMode Property R/W

Syntax **BOOL AsyncMode;**

Remarks If TRUE, then the **Sound** method will be performed asynchronously.
If FALSE, tones are generated synchronously.

This property is initialized to FALSE when the device is first enabled following the **Open** method. (In releases prior to 1.5, this description stated that initialization took place by the **Open** method. In Release 1.5, it was updated for consistency with other devices.)

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
-------	---------

OPOS_SUCCESS	The property was set successfully.
--------------	------------------------------------

CapPitch Property

Syntax **BOOL CapPitch;**

Remarks If TRUE, then the hardware tone generator has the ability to vary the pitch of the tone;
otherwise it is FALSE.

This property is initialized by the **Open** method.

CapVolume Property

Syntax **BOOL CapVolume;**

Remarks If TRUE, then the hardware tone generator has the ability to vary the volume of the tone;
otherwise it is FALSE.

This property is initialized by the **Open** method.

InterToneWait Property R/W

Syntax **LONG InterToneWait;**

Remarks The number of milliseconds of silence between tone-1 and tone-2.
If a gap is required after tone-2 but before a repeat of tone-1, then set the **Sound** parameter *InterSoundWait*.

This property is initialized to zero when the device is first enabled following the **Open** method. (In releases prior to 1.5, this description stated that initialization took place by the **Open** method. In Release 1.5, it was updated for consistency with other devices.)

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An illegal value was specified.

Tone1Duration Property R/W

Syntax **LONG Tone1Duration;**

Remarks The duration of the first tone in milliseconds. A value of zero or less will cause this tone not to sound.

This property is initialized to zero when the device is first enabled following the **Open** method. (In releases prior to 1.5, this description stated that initialization took place by the **Open** method. In Release 1.5, it was updated for consistency with other devices.)

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An illegal value was specified.

Tone1Pitch Property R/W

Syntax **LONG Tone1Pitch;**

Remarks The pitch or frequency of the first tone in hertz. A value of zero or less will cause this tone not to sound.

If the device does not support user-defined pitch (**CapPitch** is FALSE), then any value greater than zero indicates that the tone indicator uses its default value.

This property is initialized to zero when the device is first enabled following the **Open** method. (In releases prior to 1.5, this description stated that initialization took place by the **Open** method. In Release 1.5, it was updated for consistency with other devices.)

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An illegal value was specified.

Tone1Volume Property R/W

Syntax **LONG Tone1Volume;**

Remarks The volume of the first tone in percent of the device's capability, where 0 (or less) is silent and 100 (or more) is maximum.

If the device does not support user-defined volume (**CapVolume** is FALSE), then any value greater than zero indicates that the tone indicator uses its default value.

This property is initialized to 100 when the device is first enabled following the **Open** method. (In releases prior to 1.5, this description stated that initialization took place by the **Open** method. In Release 1.5, it was updated for consistency with other devices.)

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An illegal value was specified.

Tone2Duration Property R/W

Syntax **LONG Tone2Duration;**

Remarks The duration of the second tone in milliseconds. A value of zero or less will cause this tone not to sound.

This property is initialized to zero when the device is first enabled following the **Open** method. (In releases prior to 1.5, this description stated that initialization took place by the **Open** method. In Release 1.5 updated for consistency with other devices.)

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An illegal value was specified.

Tone2Pitch Property R/W

Syntax **LONG Tone2Pitch;**

Remarks The pitch or frequency of the second tone in hertz. A value of zero or less will cause this tone not to sound.

If the device does not support user-defined pitch (**CapPitch** is FALSE), then any value greater than zero indicates that the tone indicator uses its default value.

This property is initialized to zero when the device is first enabled following the **Open** method. (In releases prior to 1.5, this description stated that initialization took place by the **Open** method. In Release 1.5, it was updated for consistency with other devices.)

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An illegal value was specified.

Tone2Volume Property R/W

Syntax **LONG Tone2Volume;**

Remarks The volume of the second tone in percent of the device's capability, where 0 (or less) is silent and 100 (or more) is maximum.

If the device does not support user-defined volume (**CapVolume** is FALSE), then any value greater than zero indicates that the tone indicator uses its default value.

This property is initialized to 100 when the device is first enabled following the **Open** method. (In releases prior to 1.5, this description stated that initialization took place by the **Open** method. In Release 1.5, it was updated for consistency with other devices.)

Return When this property is set, the following value is placed in the **ResultCode** property:

Value	Meaning
OPOS_SUCCESS	The property was set successfully.
OPOS_E_ILLEGAL	An illegal value was specified.

Methods

Sound Method

Syntax **LONG Sound (LONG *NumberOfCycles*, LONG *InterSoundWait*);**

Parameter	Description
<i>NumberOfCycles</i>	If OPOS_FOREVER, then start the indicator sounding, and repeat continuously. Else perform the sound for the specified number of cycles.
<i>InterSoundWait</i>	When <i>NumberOfCycles</i> is not one, then pause for <i>InterSoundWait</i> milliseconds before repeating the tone cycle (before playing tone-1 again).

Remarks Sound the indicator, or start it sounding asynchronously.

This method is performed synchronously if **AsyncMode** is FALSE, and asynchronously if **AsyncMode** is TRUE.

The duration of an indicator cycle is:

Tone1Duration property +
InterToneWait property +
Tone2Duration property +
InterSoundWait parameter (except on the last tone cycle)

After the tone indicator has started an asynchronous sound, then the sound may be stopped by using one of the following methods. (When a *NumberOfCycles* value of OPOS_FOREVER was used to start the sound, then the application must use one of these to stop the continuous sounding of the tones.)

- **ClearOutput**
- **SoundImmediate**

Return One of the following values are returned by the method, and also placed in the **ResultCode** property.

Value	Meaning
OPOS_SUCCESS	Indicates that the indicator was sounded or has been started.

OPOS_E_CLAIMED	Indicates that another application has claimed the device and has taken over the speaker causing the sound from this method to be interrupted (can only be returned if AsyncMode is FALSE).
OPOS_E_ILLEGAL	One of the following errors occurred: <ul style="list-style-type: none">• <i>NumberOfCycles</i> is neither a positive, non-zero value nor OPOS_FOREVER.• <i>NumberOfCycles</i> is OPOS_FOREVER when AsyncMode is FALSE.• A negative <i>InterSoundWait</i> was specified
<i>Other Values</i>	See ResultCode .

SoundImmediate Method

Syntax	LONG SoundImmediate ();
Remarks	Sounds the hardware tone generator once, synchronously. Both tone-1 and tone-2 are sounded, with their InterToneWait . If asynchronous output is outstanding, then it is terminated before playing the immediate sound (as if ClearOutput were called). SoundImmediate is primarily intended for use in exception conditions when asynchronous output is outstanding, such as within an error event handler.

Return	One of the following values are returned by the method, and also placed in the ResultCode property.
---------------	--

Value	Meaning
OPOS_SUCCESS	Indicates that the indicator was sounded or has been started.
<i>Other Values</i>	See ResultCode .

A P P E N D I X A

Change History

Release 1.01

Release 1.01 mostly adds clarifications and corrections, but the Line Display and Signature Capture chapters received substantive changes to correct deficiencies in their definition.

Release 1.01 replaces Release 1.0. The **ControlObjectVersion** for a compliant Control Object is 1000xxx, where xxx is a vendor-specific build number. The **ServiceObjectVersion** for a compliant Service Object is 1000xxx, where xxx is a vendor-specific build number.

Section	Change
Second Page	Add name of Microsoft Web site for OPOS information.
Introduction When ... Properties May Be Accessed	Update to say that capabilities are initialized at Open , others may not be initialized until DeviceEnabled = TRUE, and properties remain initialized until the Control is closed.
Introduction Device Sharing Model	If an exclusive device is Released , then re Claimed , settable device characteristics are restored to their state at Release .
Common Release method	If device is enabled, then disable before releasing.
Cash Drawer WaitForDrawerClose method	<i>BeepFrequency</i> is in hertz.
Hard Totals General Information	Recommend claiming necessary files before a BeginTrans , to ensure that CommitTrans does not fail.

Keylock General Information

Claim will return OPOS_E_ILLEGAL, not success.

Line Display General Information

Major clarification of line display usage modes; including intercharacter wait and marquee.

Line Display MarqueeFormat property

Add this property.

Line Display MarqueeType property

Add DISP_MT_INIT value.

Line Display ClearText and **RefreshWindow** methods

Clarify their functionality.

POS Printer XxxLetterQuality properties

Add initialization information.

POS Printer XxxLineWidth properties

Clarify these properties.

POS Printer CapConcurrentXxxXxx properties

Clarify that if a “concurrent” capability is false, then the application should print to only one of the stations at a time, and not alternate print lines between them.

POS Printer CapXxxNearendSensor properties

Rename to **CapXxxNearEndSensor** for consistency with **XxxNearEnd** properties.

POS Printer CapXxxBarcode properties

Rename to **CapXxxBarCode** for consistency with **PrintBarCode** method.

Scale Summary

Change **ClearInput** method to *Not Supported*. Scale input is not event-driven.

Scale WeightUnit property

Change to read-only property.

Signature Capture MaximumX and **MaximumY** properties

Clarify that maximum value is 65,535.

Signature Capture TotalVectors and **VectorArray** properties

Rename to **TotalPoints** and **PointArray**. Update the General Information and the property remarks sections for consistency.

Signature Capture **PointArray** property

Clarify that each point is represented by four characters:
x (low 8 bits), x (high 8 bits), y (low 8 bits), y (high 8 bits).

Throughout

Update the property initialization details.

OposDisp.h header file

Add DISP_MT_INIT constant and **MarqueeFormat** constants.

Appendix C **Technical Details**

Add this appendix, with the sections:

- System strings and binary data.
- Event Handler Restrictions.

Release 1.1

Release 1.1 adds APIs based on requirements from OPOS-J, the Japanese OPOS consortium.

Release 1.1 is a superset of Release 1.01.

Section	Change
POS Keyboard	New device: Add information in several locations, plus POS Keyboard chapter and header file.
Second Page	Remove CompuServe reference.
Line Display CapCharacterSet property	Add values for Kana and Kanji.
Line Display CharacterSet property	Add Windows code page information.
POS Printer Data Characters and Escape Sequences	Add new sequences for: Feed and Paper cut Feed, Paper cut, and Stamp Feed lines Feed units Feed reverse Font typeface selection Reverse video Shading Scale horizontally Scale vertically Add width selection for underline sequence.
POS Printer: Add the following properties and methods:	CapCharacterSet property CapTransaction property ErrorLevel property ErrorString property FontTypefaceList property RecBarCodeRotationList property RotateSpecial property SlpBarCodeRotationList property TransactionPrint method ValidateData method

POS Printer **CharacterSet** property

Add Windows code page information.

POS Printer **PrintBarcode** method

Add information on effects of the **RotateSpecial** property.

POS Printer **PrintImmediate** and **PrintNormal** methods

Clarify the effects of Carriage Return and Line Feed.

Scanner **ScanData** property

Clarify the data that is present in this property.

OposDisp.h header file

Add **CapCharacterSet** values for Kana and Kanji.

OposPtr.h header file

Add **CapCharacterSet** values.

Add **ErrorLevel** values.

Add **TransactionPrint** *Control* values.

Release 1.2

Release 1.2 adds additional device classes, plus additional APIs based on requirements from various OPOS-US, OPOS-Japan, and OPOS-Europe members.

Release 1.2 is a superset of Release 1.1.

Section	Change
Cash Changer	New device: Add information in several locations, plus Cash Changer chapter and header file.
Tone Indicator	New device: Add information in several locations, plus Tone Indicator chapter and header file.
Several places	When a method has a <i>Timeout</i> parameter, added the constant OPOS_FOREVER as a value, and noted that OPOS_E_ILLEGAL can be returned.
First Two Pages	Update company names. Update copyright notices. Update web reference.
Introduction How an Application Uses an OPOS Control and Device Sharing Model	Explicitly state that a control may be simultaneously opened by many applications, but may be restricted in its functionality based on the Claim method.
Introduction Events	Add this section.
Introduction Input Model	Clarify the handling of error conditions. Add usage of AutoDisable and DataCount . Clarify the Error state exit conditions. Clarify when ClearInput is legal.
Introduction Output Model	Clarify the Error state conditions.
Introduction Result Code Model	Clarify the setting of ResultCodeExtended .

Common BinaryConversion, AutoDisable, and DataCount properties

Add these new properties.

Throughout document, add to Summary sections for each device class.

Throughout document, specify the BString properties and method parameters that are affected by **BinaryConversion**.

Common ControlObjectVersion and ServiceObjectVersion properties

Add compliance information when versions don't match.

Common FreezeEvents property

Clarify **FreezeEvents** role in delaying event firing.

Common ResultCodeExtended property

Clarify the setting of **ResultCodeExtended**.

Common ClearInput and ClearOutput methods

Correct return value information: May return one of three statuses.

Common Open method Correct return value information: **ResultCode** may not match method return value.

Common Release method

Correct **DeviceEnabled** side effects: Only exclusive use devices are disabled during the **Release**.

Common StatusUpdateEvent event

Clarify the initial firing of events at device enable.

MICR BankNumber Correct definition to digits 4-8 of the **TransitNumber**.

MSR ErrorReportingType

Add this new property.

MSR ParseDecodeData

Clarify inconsistency: Both **ParseDecodeData** and **ParseDecodedData** were used for this property.

MSR ErrorEvent Update for track level error notification.

POS Keyboard General Information

Clarify the type of keyboards that may be a POS Keyboard.

POS Keyboard POSKeyData property

Update definition of this property: A logical key value..

POS Keyboard CapKeyUp, EventTypes, and POSKeyEventProperty properties

Add these new properties.

POS Printer Escape Sequences

Clarify that escape sequences that are not OPOS sequences are passed through to the printer.

POS Printer **CapConcurrentXxxYyy**

Clarify the interpretation of a FALSE value.

POS Printer **XxxLineSpacing**

Clarify that line spacing includes the printed line height.
Could have been interpreted as only the whitespace between each pair of lines.

POS Printer **PrintBarCode**

Add list of symbologies.

POS Printer **MapMode** and **XxxLetterQuality**

Clarified legal handling of **MapMode** when the printer supports half-dots.
Clarified potential impact on metrics when **XxxLetterQuality** is changed and **MapMode** is dots.

POS Printer **SetBitmap**

Extend the bitmap number usage to allow the same bitmap to be used for both receipt and slip.

POS Printer **TransactionPrint**

Clarify when Busy and Extended statuses may be returned.

POS Printer **ValidateData**

Add “Underline” to the Illegal status section.

Scale Model

Correct to state the weight unit is defined by the device, and not settable by the application.

Scale **CapDisplay**

Add this new property.

Scale **WeightUnit**

Clarify inconsistency: Both **WeightUnit** and **WeightUnits** were used for this property.

Scanner **ScanDataLabel** and **ScanDataType**

Add these new properties.

Signature Capture “Real Time” feature

Add the new properties **CapRealTimeData** and **RealTimeDataEnabled**.
Update various sections for real time operation.

Change History **Release 1.1**

	Remove the compliance requirements for 1.1 Control Objects. This information was corrected and added to the common ControlObjectVersion and ServiceObjectVersion properties.
Opos.h header file	Add OPOS_FOREVER constant. Add BinaryConversion values.
OposMsr.h header file	Add ErrorReportingType values.
OposKbd.h header file	Add EventTypes values.
OposPtr.h header file	Remove PTR_RP_NORMAL_ASYNC. Add symbologies to match scanner.
OposScan.h header file	Add symbologies for ScanDataType .
Technical Details “Event Handlers”	Delete section. Much of the information was inaccurate, and the rest was merged into the new “Events” section in the first chapter.
Throughout	Correct various editing errors.

Release 1.3

Release 1.3 adds additional device classes, a few additional APIs, and some corrections.

Release 1.3 is a superset of Release 1.2.

Section	Change
First Two Pages	Update copyright notices. Update web reference.
General	Modify the use of the term event “firing.” Use “enqueue” and “deliver” appropriately to describe event firing.
Bump Bar	New device: Add information in several locations, plus Bump Bar chapter and header file.
Fiscal Printer	New device: Add information in several locations, plus Fiscal Printer chapter and header file.
PIN Pad	New device: Add information in several locations, plus PIN Pad chapter and header file.
Remote Order Display	New device: Add information in several locations, plus Remote Order Display chapter and header file.
Several places	Relax ErrorEvent “retry” response to allow its use with some input devices.
Introduction Events	Clarify effect of the top event being blocked.
Introduction Input Model	Add details concerning enqueueing and delivery of ErrorEvents . Add description of asynchronous input.
Introduction Device Power Reporting Model	Add this section.
Introduction OPOS Control Descriptions	Add CURRENCY data type.
Common CapPowerReporting, PowerNotify, PowerState properties	Add these properties here, plus... Add to the Summary section of each device.

Common ResultCode property	Generalize the meaning of OPOS_E_BUSY.
Common StatusUpdateEvent	Add power state reporting information. Change parameter name from <i>Data</i> to <i>Status</i> .
Every Device	Add power reporting properties to Summary section. Add StatusUpdateEvent support (if previously not reported). Add power reporting reference to existing StatusUpdateEvent descriptions.
MSR DecodeData	Add “raw format” description and column to track data table.
MSR ExpirationDate	Specify the format.
MSR TrackData	Specify that data excludes the sentinels and LRC. Add that decoding occurs when DecodeData is TRUE.
MSR ErrorEvent	Clarify that DataCount and AutoDisable are not relevant for MSR error events.
POSPrinter XxxLineChars	Add implementation recommendations.
POSPrinter PrintTwoNormal	Clarify the meaning of the <i>Stations</i> parameter, including the addition of new constants.
Scale	Add the following features: <ul style="list-style-type: none"> Asynchronous input. Property AsyncMode. Method ClearInput, updates to ReadWeight. Events DataEvent and ErrorEvent. Display of text. Properties CapDisplayText, MaxDisplayTextChars. Method DisplayText. Price calculation. Properties CapPriceCalculating, SalesPrice, UnitPrice. Tare weight. Properties CapTareWeight, TareWeight. Scale zeroing. Property CapZeroScale. Method ZeroScale.

Tone Indicator **Summary** and **General Information's Device Sharing**

Consistently specify that Tone Indicator is a sharable device.

Opos.h header file Add **CapPowerReporting**, **PowerState**, and **PowerNotify** properties.
Add **StatusUpdateEvent** power reporting values.

OposPtr.h header file Add new **PrintTwoNormal** station constants.

Throughout Correct some editing errors.

Release 1.4

Release 1.4 adds one additional device class.

Release 1.4 is a superset of Release 1.3.

Section	Change
CAT	Added new device class, Credit Authorization Terminal which includes CAT chapter and header file. This device class was added at the request of OPOS-J and is used primarily in Japan. No other revisions were made to the version 1.3 of the OPOS specification.

Release 1.5

Release 1.5 is a superset of Release 1.4.

Release 1.5 adds 2 additional device classes.

Section	Change
First Two Pages	Update copyright notices. Update web references.
General	Replace Claim with ClaimDevice and Release with ReleaseDevice .
Introduction	Update references to OLE to ActiveX where appropriate.
Common OpenResult property	Add new property, plus add to the Summary section of each device.
Common ClaimDevice and ReleaseDevice	Name change plus update remarks.
Cash Changer	Added support for receipt of money functionality.
Cash Drawer	Added multi-drawer handling.
CAT	Added PaymentMedia property. The TransactionNumber property summary was changed to correctly show the type as String.
Fiscal Printer	Properties CountryCode , ErrorOutID , PrinterState , QuantityDecimalPlaces and QuantityLength have been updated to reflect the fact that they should be initialized after Open instead of Open, Claim and Enable. DuplicateReceipt : Corrected to show that is R/W. Added return values.
Line Display	Added DISP_CCS_UNICODE to CapCharacterSet and DISP_CS_UNICODE to CharacterSet to allow for devices that support the UNICODE character set.
MSR	Added Track4Data , CapTransmitSentinels and TransmitSentinels properties. Clarified support for JIS-II track data.

	<p>DataEvent status: Added meaning for the high byte.</p> <p>ErrorEvent's ResultCodeExtended when ResultCode=OPOS_E_EXTENDED: Added meaning for the high byte.</p>
PINPad	Added Track4Data property.
Point Card Reader Writer	<p>New device: Add information in several locations, plus Point Card Reader Writer chapter and header file.</p>
POS Keyboard	CapKeyUp : Corrected type from LONG to BOOL.
POS Power	New device: Add information in several locations, plus POS Power chapter and header file.
POS Printer	<p>Added support for color printing (ink jet technology), printing both sides on the slip station and mark feed paper.</p> <p>Added PTR_CCS_UNICODE to CapCharacterSet and PTR_CS_UNICODE to CharacterSet to allow for devices that support the UNICODE character set.</p>
Remote Order Display	Added ROD_CCS_UNICODE to CapCharacterSet and ROD_CS_UNICODE to CharacterSet to allow for devices that support the UNICODE character set.
Scale	<p>Properties SalesPrice, TareWeight and UnitPrice have been updated to reflect the fact that they should be initialized after Open instead of Open, Claim and Enable.</p> <p>ErrorEvent: Added OPOS_ER_RETRY as a value response.</p>
Signature Capture	<p>Update Model to discuss AutoDisable implications.</p> <p>RealTimeDataEnabled: Clarify when this takes effect.</p> <p>DataEvent: Correct conditions when this event may be fired to include real-time data.</p>
Tone Indicator	<p>Properties AsyncMode, Tone1Pitch, Tone1Volume, Tone1Duration, Tone2Pitch, Tone2Volume, Tone2Duration and InterToneWait have been updated to reflect the fact that they should be initialized after Open instead of Open, Claim and Enable.</p>

	Clarified handling of the Sound method when another application claims the device and calls the Sound method.
Opos.h header file	Add OpenResult property values.
Appendix C	Added header files for Point Card Reader Writer and POS Power. Updated other header files for devices modified in this specification.
Appendix D	Update System String information to include ATL usages.
Appendix E	Added this appendix for details on ClaimDevice and ReleaseDevice .

Release 1.6

Release 1.6 is a superset of Release 1.5.

Section	Change
Line Display	<p>Added the CapBlinkRate, CapCursorType, CapCustomGlyph, CapReadBack, CapReverse, BlinkRate, CursorType, CustomGlyphList, GlyphHeight and GlyphWidth properties.</p> <p>Added DefineGlyph and ReadCharacterAtCursor methods.</p> <p>Many updates in the General Information section.</p> <p>Updated the DisplayText and DisplayTextAt methods to include support for new attribute types for reverse video, DISP_DT_REVERSE and DISP_DT_BLINK_REVERSE.</p>
Fiscal Printer	<p>Added the CapAdditionalHeader, CapAdditionalTrailer, CapChangeDue, CapEmptyReceiptIsVoidable, CapFiscalReceiptStation, CapFiscalReceiptType, CapMultiContractor, CapOnlyVoidLastItem, CapPackageAdjustment, CapPostPreLine, CapSetCurrency, CapTotalizerType, ActualCurrency, AdditionHeader, AdditionalTrailer, ChangeDue, ContractorId, DateType, FiscalReceiptStation, FiscalReceiptType, MessageType, PostLine, PreLine and TotalizerType properties.</p> <p>Added the SetCurrency, PrintRecCash, PrintRecItemFuel, PrintRecItemFuelVoid, PrintRecPackageAdjustment, PrintRecPackageAdjustVoid, PrintRecRefundVoid, PrintRecSubtotalAdjustVoid and PrintRecTaxID methods.</p> <p>Added country support for Bulgaria and Romania.</p> <p>Many updates in the General Information section.</p> <p>Clarified the description of the CapPositiveAdjustment property.</p>

	Updated the CountryCode , DayOpened and DescriptionLength properties to reflect additions to the specification.
	Updated the EndFiscalReceipt , GetData , GetDate , PrintRecItem , PrintRecMessage , PrintRecNotPaid , PrintRecRefund , PrintRecSubtotal , PrintRecSubtotalAdjustment , PrintRecTotal , PrintRecVoid , PrintRecVoidItem , PrintZReport and SetHeaderLine methods to reflect additions to the specification.
	Updated the ErrorEvent event to reflect additions to the specification.
	Properties CountryCode , ErrorOutID , PrinterState , QuantityDecimalPlaces and QuantityLength have been updated to tone down strong language in the 1.5 revision that changes the “Initialized After” text.
Scale	Properties SalesPrice , TareWeight and UnitPrice have been updated to tone down strong language in the 1.5 revision that changes the “Initialized After” text
Tone Indicator	Properties AsyncMode , Tone1Pitch , Tone1Volume , Tone1Duration , Tone2Pitch , Tone2Volume , Tone2Duration and InterToneWait have been updated to tone down strong language in the 1.5 revision that changes the “Initialized After” text.
Appendix C	Added new constants for Fiscal Printer and Line Display updates.

APPENDIX B

OPOS Registry Usage

OPOS Controls require some data in the system registry in order for the Control Objects to locate the proper Service Object and initialize it for the device.

The registry is organized in a hierarchical structure, in which each level is named a “key.” Each key may contain:

- Additional keys (sometimes called “subkeys”).
- Zero or more named “values.” A value is assigned “data” of type string, binary, or double-word.
- One “default value” that may be assigned data of type string.

OPOS only defines string data.

Service Object Root Registry Key

All OPOS Service Object entries should be placed under the following main key:

HKEY_LOCAL_MACHINE\SOFTWARE\OLEforRetail\ServiceOPOS

The “HKEY_LOCAL_MACHINE\SOFTWARE” key is the recommended key for software configuration local to the PC. The “OLEforRetail” key will group all OLE for Retail related configuration information. The “ServiceOPOS” key maintains configuration information for OPOS Service Objects.

Device Class Keys

Each class has an identifying Device Class subkey under the main OPOS key. The following key names have been established:

BumpBar
CashChanger
CashDrawer
CAT
CoinDispenser
FiscalPrinter

HardTotals
 Keylock
 LineDisplay
 MICR
 MSR
 PINPad
 PointCardRW
 POSKeyboard
 POSPower
 POSPrinter
 RemoteOrderDisplay
 Scale
 Scanner
 SignatureCapture
 ToneIndicator

Device Name Keys and Values

Each device within a class is assigned a Device Name subkey under the class's key. This should be performed by a Service Object installation procedure. This Device Name key is passed to the Control Object's **Open** method by the application. The Device Name is not constrained, except that it must be unique among the names under the device class.

The default value of the Device Name key is the programmatic ID¹¹ of the Service Object. This string is needed by the Control Object, so that the Service Object may be loaded and the OLE Automation interfaces established between the CO and the SO.

<i>Value – Required</i>	Data
(Default)	Service Object's OLE Programmatic ID.

The device unit key's values and their data describe the characteristics of the actual device on the terminal or PC. The following values are strongly recommended for use by installation and support personnel:

<i>Value – Recommended</i>	Data
Service	Filename of the Service Object.
Description	String describing the Service Object.

¹¹ A Programmatic ID, or "Prog ID", is the name of a key that must appear in the "HKEY_CLASSES_ROOT" section of the registry. This key must have a subkey named "CLSID", which is the Class ID associated with the Prog ID. The Class ID must be a key within the "HKEY_CLASSES_ROOT\CLSID" registry section. This key contains subkeys that specify the OLE Automation Server type and that instruct OLE how to start the Server.

Version	String containing the Service Object version number. General format is: MajorVersion.MinorVersion.BuildVersion.
---------	--

Other values may be defined as needed by the Service Object. Values might contain information such as:

- Communications Port
- Baud Rate
- Serial Line Characteristics
- Interrupt Request (IRQ) Values
- Input/Output (I/O) Ports

Logical Device Name Values

An application may open a Control by passing the Device Name key to the **Open** method. In many cases, however, the application will want a level of isolation where the application specifies a “Logical Device Name” that is translated into a Device Name.

A Logical Device Name is added to the registry as a value contained in the Device Class key. The value name is set to the Logical Device Name, and its data must match a Device Name key contained in the same Device Class.

The application integrator is responsible for adding Logical Device Names to the registry. (They are not added by the Service Object install procedure.)

Service Provider Root Registry Key

The SO service providers may need to store some information in the registry that is common to some or all of its Service Objects. This data could include installation directories, installation date, and deinstall information. Service provider information should be placed under the following main key:

HKEY_LOCAL_MACHINE\SOFTWARE\OLEforRetail\ServiceInfo

The subkeys under this key should be the names of service provider companies. Subkeys and values within each service provider company subkey are provider-dependent.

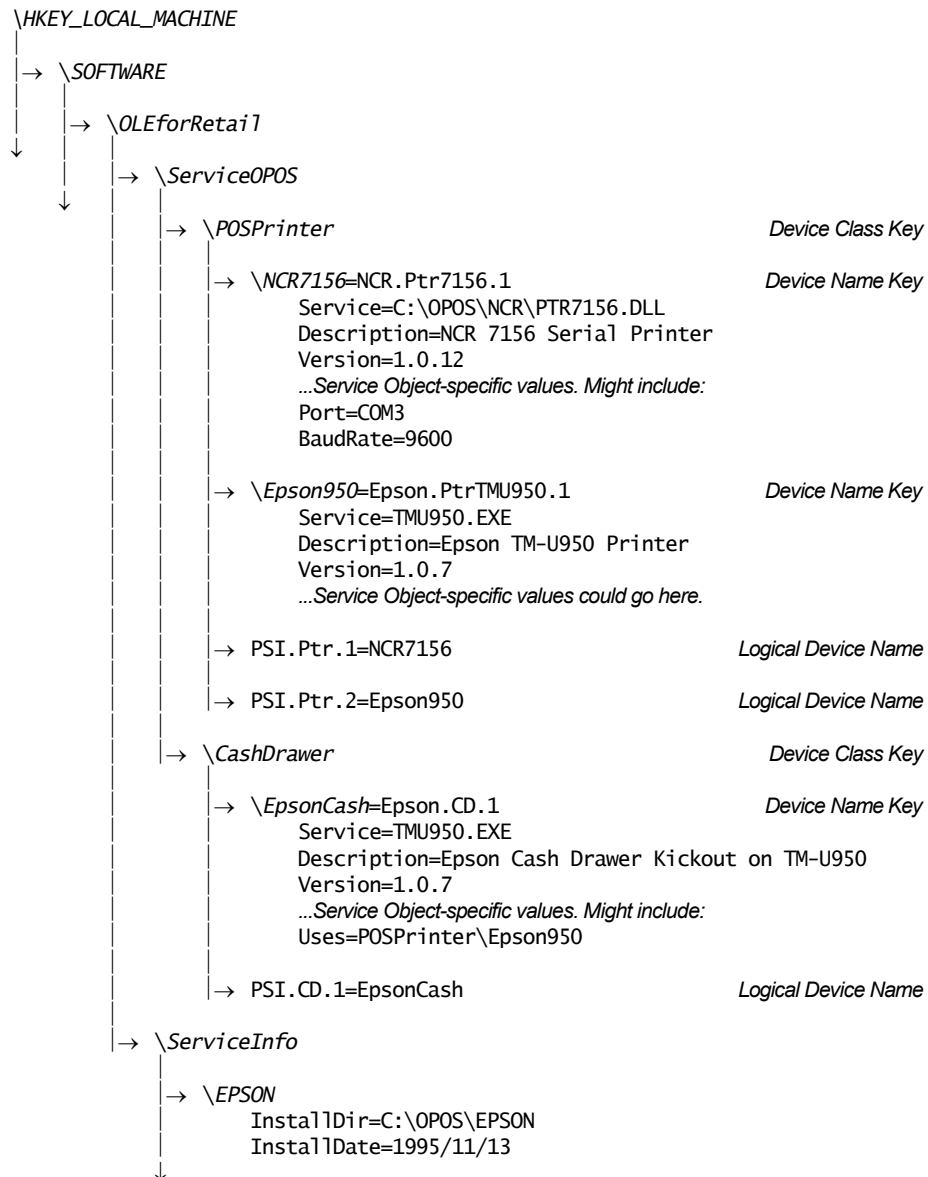

Example

In this example, keys are listed in *italics*. Comments appear as **comment**.

Two device classes are given: POSPrinter and CashDrawer.

The POSPrinter class contains two Device Names. Also, two Logical Device Names are present, which point to the Device Names.

The CashDrawer class contains one Device Name and one Logical Device Name. The Service Object has a unique Prog ID but uses the same executable as one of the printers. This Service Object could use the example value “Uses” to point to some registry values of the printer device that can be used for the cash drawer parameters.

APPENDIX C

OPOS Application Header Files

The header files are listed in alphabetical order. The mapping of device class name to header file name is as follows:

– General –	Opos.h
Bump Bar	OposBb.h
Cash Changer	OposChan.h
Cash Drawer	OposCash.h
CAT	OposCat.h
Coin Dispenser	OposCoin.h
Fiscal Printer	OposFptr.h
Hard Totals	OposTot.h
Keylock	OposLock.h
Line Display	OposDisp.h
MICR	OposMcr.h
MSR	OposMsr.h
PIN Pad	OposPpad.h
Point Card Reader Writer	OposPcrw.h
POS Keyboard	OposKbd.h
POS Power	OposPwr.h
POS Printer	OposPtr.h
Remote Order Display	OposRod.h
Scale	OposScal.h
Scanner	OposScan.h
Signature Capture	OposSig.h
Tone Indicator	OposTone.h

Opos.h : Main OPOS Header File

```

/////////////////////////////////////////////////////////////////

Technical Details

System Strings (BSTR)

System String Characteristics

OPOS uses OLE system strings to pass and return data of variable length. System strings are often referred to as BStrings, and are assigned the type BSTR by Microsoft Visual C++.

A system string consists of a sequence of Unicode characters, which are each 16-bits wide. Thus, they are also referred to as “wide” characters. The string is followed by a NUL, or zero, character. The string is preceded by an unsigned long count of the bytes in the string, not including the NUL. Divide this count by two to obtain the number of characters in the string.

Most of the time, OPOS uses system strings to pass character data back and forth among the Application, Control Object, and System Object. A system string (BSTR) is used to pass string parameters by methods and to return string properties. A pointer to a system string (BSTR*) is used as a method parameter when the method must return string data.

System String Usage

Visual Basic both receives and sends system strings without any complications. The internal representation of VB strings is as wide characters with a length component. A BSTR may be passed using a variable, a string expression, or a literal. A BSTR* requires use of a variable, so that the data may be modified by the method.

Similarly, Visual C++ using ATL is straightforward. BSTR and BSTR* data is passed and received using these types. Any translation to or from Unicode is the developer's responsibility.

Visual C++ with MFC, however, requires more consideration.

BSTR is handled as follows:

- BSTR Method Parameters
 - ◆ **Calling Function** Calling an automation method with a BSTR parameter is treated by MFC as a pointer to a character string, LPCTSTR. If the VC++ ANSI option is used, MFC automatically converts from ANSI to Unicode.
 - ◆ **Called Function** The function implementing an automation method receives a BSTR parameter as a pointer to a character string, LPCTSTR. If the VC++ ANSI option is used, then MFC performs an automatic conversion from Unicode into ANSI before passing control to the function. The string length immediately precedes the string pointer.
- BSTR Return Type (used for getting properties)
 - ◆ **Calling Function** An automation method returning a BSTR result is automatically converted by MFC into a CString.
 - ◆ **Called Function** An automation method returns a BSTR result by placing the data into an MFC CString object, and returning the result of the CString's "AllocSysString" member function. If the VC++ ANSI option is used, then this function automatically converts the string from ANSI into Unicode.

BSTR* is passed and received by MFC as BSTR*, so the developer handling is the same as with ATL. Some MFC macros and classes may be helpful:

- If the VC++ ANSI option is used, then conversion between Unicode and MBCS is required. Some macros are available that make this conversion easier, such as T2OLE and OLE2T. (These do not handle NUL characters embedded in the string, however.)
- To set the string, place the data into an MFC CString object, and use CString's "SetSysString" member function.

System Strings and Binary Data

Sometimes OPOS uses BSTR and BSTR* to pass binary data.

These cases may return byte data in the range 00-hex to FF-hex. Each 16-bit character of the system string contains one byte of binary data in the lower 8 bits. The upper 8 bits are zero. This can lead to two problematic areas:

- The NUL character, or zero. Although system strings have a length component, some software still relies upon the NUL character to determine the end of the string.
- Characters in the range 0x80 – 0xFF. The translation between ANSI and Unicode formats may yield incorrect data, especially for eastern languages.

In order to avoid these translation and transmission problems, an Application should employ the **BinaryConversion** feature if data outside the range of 0x01 – 0x7F may be sent or received by a method parameter or a property. **BinaryConversion**, added in Release 1.2, supports two means of converting data between binary and ASCII formats.

Release 1.5 API Change: ClaimDevice and ReleaseDevice

The common methods **Claim** and **Release** were defined in the very first OPOS release. Since that time, an increased number of conflicts have occurred between the OPOS **Release** method and the COM **Release** method, which is a required method of every COM object. This conflict has required some development restrictions:

- Control Objects and Service Objects must define their interfaces as pure dispatch interfaces. This has precluded the use of the Microsoft Visual C++ Active Template Library, since ATL only supports IDispatch via a dual interface implementation.
- Some development environments assume that ActiveX Controls will not define a dispatch method that conflicts with COM. For example, users of Delphi have had to work around the **Release** conflict. Future tools may be even less tolerant of this conflict.

Therefore, these methods have been renamed to **ClaimDevice** and **ReleaseDevice** in Release 1.5.

Several steps have been taken to provide a maximal migration of Applications and Service Objects. These have been implemented in the reference set of Control Objects known as the “Common Control Objects”:

- **Application.**

Both the **ClaimDevice** and **Claim** methods and the **ReleaseDevice** and **Release** methods are supported by the Control Object’s IDispatch interface. The IDispatch interface is used by an application to implement late binding. By doing this, full backward compatibility is provided for current late bound Applications.

If an application using a development environment that performs early binding (including Microsoft Visual C++ and Visual Basic) changes from a 1.4 or earlier Control Object to a 1.5 or later Control Object, then it will also have to update all **Claim** calls to **ClaimDevice**, and **Release** calls to **ReleaseDevice**.

- **Service Object.**

A Service Object may expose either the **Claim** or **ClaimDevice** method and either the **Release** or **ReleaseDevice** method through its IDispatch interface. Note that if the Service Object is implemented using ATL, then it must use **ReleaseDevice**, since **Release** is reserved for COM’s IUnknown reference counting.

When the Application calls **ClaimDevice** or **Claim**, the Control Object calls the Service Object method **ClaimDevice** if present; otherwise it calls **Claim**. When the Application calls **ReleaseDevice** or **Release**, the Control Object calls the Service Object method **ReleaseDevice** if present; otherwise it calls **Release**. By doing this, full backward compatibility is provided for current Service Objects while allowing new Service Objects to be implemented using ATL.
